6. It's possible to prove why the MR shortcut is true using calculus. Let the demand curve be written in the form $P = a - bQ$ so the slope is b . Total revenue is $P \times q = TR = aQ - bQ^2$. Marginal revenue is the derivative of total revenue with respect to quantity or $MR = \frac{dTR}{dQ} = a - 2bQ$. Notice that the slope of the MR curve is $2b$, twice the slope of the demand curve.
