šom kroku tieto hodnoty korigujeme pravdepodobnosťami určenými Markovovými reťazcami, obdobne ako v predchádzajúcom príklade. K syntéze pravdepodobností určených horizontálnym vývojom modelovaného javu, ktorý je kontrolovaný tranzitnými pravidlami bunkových automatov, a pravdepodobností daných predispozíciami prostredia, v ktorom proces prebieha, je možné zvoliť väčšie množstvo prístupov. Vhodné je napr. použitie Bayesovej formuly, avšak aj operátory MIN, MAX, AVG a iné poskytujú ľahko interpretovateľné výsledky. Ilustračný príklad použitia tejto operácie je uvedený na Obr. 10.22.
