Preface to First Edition *page* xvii

Preface to Second Edition xx

Acknowledgements xxiii

1 Introduction to the study of animal populations 1

1.1 POPULATION ESTIMATES 2
1.1.1 Absolute and related estimates 2
Absolute population 2
Population intensity 2
Basic population 2
1.1.2 Relative estimates 3
1.1.3 Population indices 3

1.2 ERRORS AND CONFIDENCE 4

2 The sampling programme and the measurement and description of dispersion 7

2.1 PRELIMINARY SAMPLING 7
2.1.1 Planning and field work 7
2.1.2 Statistical aspects 9
The normal distribution and transformations 9
Taylor's power law 10
Choosing the transformation 11
Checking the adequacy of the transformation 12
The use of probability paper 13
Analysis of variance 17

2.2 THE SAMPLING PROGRAMME 17
2.2.1 The number of samples per habitat unit 17
Subdivision of the habitat 17
The number of samples per subdivision 18
2.2.2 The sampling unit, its selection, size and shape 19
2.2.3 The number of samples 21
2.2.4 The pattern of sampling 22
2.2.5 The timing of sampling 25

2.3 DISPERSION page 26
2.3.1 Mathematical distributions that serve as models 26
Binomial family 26
Calculating k of the negative binomial 28
Testing the fit of the negative binomial 29
Calculating a common k 31
Logarthmic and other contagious models 33
Implications of the distribution models and of changes in the type of distribution 33
Comparison of aggregation indices 36
2.3.2 Biological interpretation of dispersion parameters 39
Index of dispersion – the departure of the distribution from randomness 39
'*k*' of the negative binomial – an index of aggregation in the population 39
'*b*' of Taylor's power law – an index of aggregation for the species 42
Lloyd's mean crowding and Iwao's patchiness regression – indices for the population and species 43
Iwao's ρ-index – a measure of colony area 45
Breder's equations – a measure of the cohesion of aggregations 45
Deevey's coefficient of crowding 47
2.3.3 Nearest neighbour and related techniques – measures of population size or of the departure from randomness of the distribution 47
Nearest neighbour methods 48
Closest individual or distance method 49
2.4 SEQUENTIAL SAMPLING 51
2.5 PRESENCE OR ABSENCE SAMPLING 55
2.6 SAMPLING A FAUNA 56
2.7 BIOLOGICAL AND OTHER QUALITATIVE ASPECTS OF SAMPLING 57

3 Absolute population estimates using marking techniques 70

3.1 METHODS OF MARKING ANIMALS 70
3.1.1 Group marking methods 71
Paints and solutions of dyes 72
Materials 72
Application 73
Dyes and fluorescent substances in powder form 74
Labels 75
Mutilation 76

Marking internally by injection *page* 76
Marking by feeding with dyes 76
Genes, mutant and normal 77
Rare elements 77
Radioactive isotopes 78
Labels 80
Incorporation in tissues 82
Detection 85
Autoradiographic discrimination between ^{32}P and ^{35}S marked insects 86
3.1.2 Individual marking methods 86
3.1.3 Handling techniques 88
3.1.4 Release 91
3.2 CAPTURE–RECAPTURE METHODS OF ESTIMATING POPULATION PARAMETERS 92
3.2.1 Lincoln Index type methods 92
Assumptions 92
The validity of the assumptions 93
Marking has no effect 93
Equal catchability 94
Methods of calculation 97
The Lincoln Index 97
Other single mark methods 98
Review of methods for a series of marking occasions 99
Choice of method for a series of marking occasions 101
The Fisher–Ford method 102
Bailey's triple-catch method 104
The Jolly–Seber stochastic method 106
Manly & Parr's method 111
3.2.2 Frequency of capture methods (Schnabel census) 113
3.2.3 Craig's method: constant probability of capture 113
3.2.4 Change in ratio methods (Kelker's selective removal) 114

4 Absolute population estimates by sampling a unit of habitat–air, plants, plant products and vertebrate hosts 130

4.1 SAMPLING FROM THE AIR 130
4.1.1 Sampling apparatus 131
Exposed cone type of suction trap 131
Enclosed cone types of suction trap 132
Rotary and other traps 134
Comparison and efficiencies of the different types of suction traps 135

4.1.2 Conversion of catch to aerial density page 136
4.1.3 Conversion of density to total aerial population 136
4.2 SAMPLING FROM PLANTS 138
4.2.1 Assessing the plant 139
4.2.2 Determining the numbers of insects 140
Direct counting 140
The separation of exposed small animals from the foliage on which they are living 141
Knockdown – by chemicals, jarring and heat 141
Brushing 143
Washing 143
Imprinting 145
The expulsion of animals from tall vegetation 145
Jarring or beating 145
Chemical knockdown 146
Collection of naturally descending animals 148
The extraction of animals from herbage and debris 148
Suction apparatus 148
Cylinder or covering method 152
Tents for sampling strongly phototactic animals 154
Extraction by heat, drying and/or flotation 155
Methods for animals in plant tissues 155
Dissection 155
Bleaching and/or selective staining 156
X-rays 156
Methods based on the different mass of the whole and the infested material 157
Aural detection 157
4.2.3 Special sampling problems with animals in plant material 157
The marking of turf samples 157
The sampling of bulk grain 157
The sampling of bark 158
4.3 SAMPLING FROM VERTEBRATE HOSTS 158
4.3.1 Sampling from living hosts 158
Searching 158
Combing 159
Fumigation 159
4.3.2 Sampling from dead hosts 160
Searching and combing 160
Fumigation 160
Dissolving 161
Clearing 161
Washing 161
4.3.3 Sampling from vertebrate 'homes' 161

5 Absolute population estimates by sampling a unit of habitat – soil and litter *page* 170

5.1 SAMPLING 170

5.2 MECHANICAL METHODS OF EXTRACTION 172
5.2.1 Dry sieving 173
5.2.2 Soil washing (or wet sieving) 173
5.2.3 Soil washing and flotation 175
5.2.4 Flotation 178
5.2.5 The separation of plant and animal matter by differential wetting 179
5.2.6 Centrifugation 181
5.2.7 Sedimentation 181
5.2.8 Elutriation 182
5.2.9 Sectioning 183

5.3 BEHAVIOURAL OR DYNAMIC METHODS 183
5.3.1 Dry extractors 184
Large Berlese funnel 185
Horizontal extractor 185
High gradient (Multiple canister) extractor 187
Kempson bowl extractor 188
5.3.2 Wet extractors 189
Baermann funnel 189
Hot water extractors 190
Sand extractors 191
Cold water extractor 192
Mistifier 192
5.3.3 Chemical extraction 193
5.3.4 Electrical extraction 193

5.4 SUMMARY OF THE APPLICABILITY OF THE METHODS 193

6 Absolute population estimates by sampling a unit of habitat – freshwater habitats 202

6.1 OPEN WATER 202
Nets 202
Pumps and baling 204
The Clarke–Bumpus plankton sampler 204
The Belleville mosquito sampler 204

6.2 VEGETATION 205
Sampling cylinder for floating vegetation 205
Wisconsin trap 206
The Gerking sampler 206
McCauley's samplers 206
Sampling cages 206

6.3 BOTTOM FAUNA page 207
The 'Planting' of removable portions of the substrate 208
Lifting stones 210
Cylinders and boxes for delimiting an area 211
Movable nets – drags 212
Dredges and other devices for removing portions of the substrate 213
Air-lift and suction devices 218

7 Relative methods of population measurement and the derivation of absolute estimates 223

7.1 FACTORS AFFECTING THE SIZE OF RELATIVE ESTIMATES 223
7.1.1 The 'phase' of the animal 224
7.1.2 The activity of the animal 224
7.1.3 Variation in the responsiveness of different sexes and species to trap stimuli 226
7.1.4 The efficiency of the trap or searching method 227

7.2 THE USES OF RELATIVE METHODS 227
7.2.1 Measures of the availability 227
7.2.2 Indices of absolute population 228
7.2.3 Estimates of absolute population 228
'Calibration' by comparison with absolute estimates 229
Correcting the catch to allow for variations in trap efficiency 229
Line transects 230
Removal trapping or collecting 230
7.2.4 Collecting 236

7.3 RELATIVE METHODS – CATCH PER UNIT EFFORT 236
7.3.1 Visual observation 236
7.3.2 Population estimates from line transects 237
7.3.3 Observation by Radar 239
7.3.4 Aural detection 239
7.3.5 Exposure by plough 240
7.3.6 Collecting with a net or similar device 240

7.4 RELATIVE METHODS – TRAPPING 242
7.4.1 Interception traps 243
Air – flight traps 243
Water – aquatic traps 245
Land – pitfall and other traps 247
7.4.2 Flight traps combining interception and attraction 249
Sticky traps 249
Water traps 252
7.4.3 Light and other visual traps 253
Mode of action and limitations 253

The effects of trap design on catch *page* 255
Techniques and types of trap 256
The Rothamsted trap 257
The Robinson trap 257
The Pennsylvanian and Texas traps 258
The New Jersey trap 259
The Haufe–Burgess visual trap 259
The Manitoba horse fly trap 260
Aquatic light traps 261
7.4.4 Traps that attract the animal by some natural stimulus or a substitute 261
Shelter traps 262
Trap host plants 262
The use of vertebrate hosts or substitutes as bait 263
Moving baits 264
Stationary baits 265
Bait traps 268
Traps 268
Baits or lures 270
Sound traps 271

8 Estimates based on products and effects of insects 288

8.1 PRODUCTS 288
8.1.1 Exuviae 288
8.1.2 Frass 289
Identification 289
The rate of frass production 290
Efficiency of collection 290
8.1.3 Other products 290

8.2 EFFECTS 292
8.2.1 Effects due to an individual insect 292
8.2.2 General effects – damage 293
Criteria 293
Economic damage 293
Loss of yield 293
The amount of plant consumed 294
Determining the relationship between damage and insect populations 296

9 Observational and experimental methods for the estimation of natality, mortality and dispersal 302

9.1 NATALITY 302
9.1.1 Fertility 302

9.1.2 Numbers entering a stage page 304
9.1.3 The birth-rate from mark and recapture data 309

9.2 MORTALITY 309
9.2.1 Total 309
9.2.2 The death-rate from mark and recapture data 310
9.2.3 Climatic factors 310
9.2.4 Biotic factors 310
Examination of the prey (host) 311
Examination of the predator 312
Serological methods 312
Labelled prey 317
Predator or parasite exclusion techniques 319
Mechanical or other barriers 319
Elimination of predator or parasite 320
Direct observation 320
Experimental assessment of natural enemies 321
Death rate of prey/prey density 321
Death rate of prey/predator density 324
Predator dispersion/prey dispresion 325
Fecundity, developmental and survival rates of predators/prey density 325
The role of other prey 325
Changes during development of the predator 327
Changes due to other animals 327
Climatic and similar effects 327

9.3 DISPERSAL 327
9.3.1 Laboratory assessments 328
9.3.2 The use of marked or introduced animals 328
The measurement and description of dispersal 328
The detection of heterogeneity, with respect to the rate of dispersal, in the individuals of the population 330
The numbers at various distances from the release point 331
The fall-off of density with distance 332
The mean-distance travelled and the rate of dispersal 334
The number of marked animals that have left an area 335
The rate of population interchange between two areas 335
The description of population displacement in relation to its dispersion 337
The measurement and description of home range and territory 338
Minimum area method 338
The matrix index 339

9.3.3 Direct field measurements page 339
The elimination of emigration 339
The use of quadrat counts of unmarked individuals 339
The rate of colonization of a new habitat 342
The direction of migration 342

10 The construction, description and analysis of age-specific life-tables 356

10.1 TYPES OF LIFE-TABLE AND THE BUDGET 356
10.2 THE CONSTRUCTION OF A BUDGET 357
10.2.1 Graphical method 358
10.2.2 Richards & Waloff's first method 360
10.2.3 Manly's method 361
10.2.4 Birley's method 362
10.2.5 Ruesink's method 363
10.2.6 Dempster's method 364
10.2.7 Richards & Waloff's second method 365
10.2.8 Kiritani, Nakasuji & Manly's method 365

10.3 THE DESCRIPTION OF BUDGETS AND LIFE-TABLES 366
10.3.1 Survivorship curves 366
10.3.2 The life-table and life expectancy 367
10.3.3 Life and fertility tables and the net reproductive rate 369
10.3.4 Population growth rates 370
10.3.5 The calculation of r 372

10.4 THE ANALYSIS OF LIFE-TABLE DATA 374
10.4.1 The comparison of mortality factors within a generation 374
Apparent mortality 374
Real mortality 374
Indispensible mortality 374
Mortality–survivor ratio 375
10.4.2 The simple statistical relationship of population size to a factor 375
10.4.3 Survival and life budget analysis 376
Varley & Gradwell's method 376
The investigation of the roles of different factors in single-generation budgets 382

11 Age-grouping of insects, time-specific life-tables and predictive population models 388

11.1 AGE-GROUPING OF INSECTS 388
11.1.1 Cuticular bands 389
11.1.2 Sclerotization and colour changes in the cuticle and wings 390
11.1.3 Developmental changes in the male genitalia 390
11.1.4 Changes in the internal non-reproductive organs 390
11.1.5 The condition of the ovaries and associated structures 391

11.1.6 Indices of copulation page 392
11.1.7 Changes in weight 392
11.1.8 'Wear and tear' 393
11.2 TIME-SPECIFIC LIFE TABLE AND SURVIVAL RATES 393
11.3 PREDICTIVE POPULATION MODELS 395
11.3.1 Physiological time 396
11.3.2 Life-table parameters 397
11.3.3 Recruitment in the field 397
11.3.4 Empirical models 397
11.3.5 Intrinsic rate models and variable life tables 398
11.3.6 Lewis-Leslie matrices 400

12 Systems analysis and modelling in ecology 407
12.1 TYPES OF SYSTEMS MODEL 408
12.1.1 Dioristic models 409
12.1.2 Component models 409
12.1.3 Strategic models 410
Deductive and mixed models 411
Inductive models 412
12.1.4 Management models 412
Population management models 413
Ecosystem (biome) models 414
12.1.5 Statistical models 414
12.2 ANALYSIS AND SIMULATION IN MODELS 414
12.3 DETERMINISTIC AND STOCHASTIC MODELS 415
12.4 DIFFERENCE AND DIFFERENTIAL MODELS 415

13 Diversity, species packing and habitat description 420
13.1 DIVERSITY 420
13.1.1 Description of α and γ diversity 421
Models for the S:N relationship 423
Geometric series 423
Logarithmic (or log) series 423
Log normal distribution 424
MacArthur's broken stick 425
Non-parametric indices 425
Shannon–Weaver function 426
Simpson–Yule index (D) 426
Berger–Parker Dominance index 427
Which model or index? 427
Procedure 429
13.1.2 Description of β -diversity 430
Indices 430

The sorting of indices page 433
Trellis diagram 433
Dendrogram 434
Cluster analysis 435
Multivariate methods 435
Gradient description 435
13.2 SPECIES PACKING 437
13.2.1 Measurement of interspecific association 438
The departure of the distribution of presence or absence from independence 438
The contingency table 439
Coefficients of association 440
Proportion of individuals occuring together 441
13.2.2 Measurement of resource utilization 441
Species packing in terms of mean and width of resource utilization specturm ('d/w' method) 443
Species packing in terms of proportional utilization of different resource states ('p_i method') 445
13.2.3 Niche size and competition coefficients 446
13.3 HABITATS 448
13.3.1 Qualitative 448
13.3.2 Quantitative 450

14 The estimation of productivity and the construction of energy budgets 456
14.1 ESTIMATION OF STANDING CROP 458
14.1.1 Measurement of biomass 458
14.1.2 Determination of caloric value 458
14.2 ESTIMATION OF ENERGY FLOW 462
14.2.1 The measurement of production 462
14.2.2 The measurement of feeding and assimilation 465
The quality of the food eaten 465
Feeding and assimilation rates 465
Radiotracer techniques 466
Gravimetric techniques 468
Indicator methods 469
14.2.3 The measurement of the energy loss due to respiration and metabolic processes 470
Calorimetric 470
The exchange of respiratory gases 470
The energy equivalents of oxygen and carbon dioxide 470
The respiratory rate 472
Gas analysis 472

14.3 THE ENERGY BUDGET, EFFICIENCIES AND TRANSFER COEFFICIENTS *page* 477
14.3.1 The energy budget of a population (or trophic level) 477
14.3.2 Energy transfer across trophic links 479
14.4 ASSESSMENT OF ENERGY AND TIME COST STRATEGIES 481

Author Index 491

General Index 516
