# Contents

Foreword . . . . . 9

**Part I. The Great Illusion of 20th Century Mathematics 11**

1. The existence of the set of all natural numbers . . . . . 13
2. The appearance of increasingly vehement warnings . . . . . 21
3. The set of all natural numbers does not exist... . . . . 29
4. The harmful effects on all infinite mathematics based on the Cantor Set Theory . . . . . 33

**Part II. A New Theory of Sets and Semisets 35**

1. Introduction . . . . . 37
2. Basic notions . . . . . 39
   - 2.1. Classes, sets and semisets . . . . . 39
   - 2.2. The horizon . . . . . 45
   - 2.3. The geometrical horizon . . . . . 52
   - 2.4. Unsharpness and infinity . . . . . 56
3. Natural numbers . . . . . 61
   - 3.1. The geometrical foundations of basic arithmetic laws . 61
   - 3.2. Eudoxus' elaboration of the interpretation of the ancient world of geometry . . . . . 66
   - 3.3. The domain of finite natural numbers and its actualisation . . . . . 71

4. Extension of finite natural numbers . . . . . 77
4.1. Natural numbers in the land of knowledge of the geometrical horizon . . . . . 77
4.2. The axiom of extension . . . . . 79
4.3. Almost immediate consequences of the axiom of extension . . . . . 80
5. Two important sorts of classes . . . . . 83
5.1. Motivation; prima facie phenomena . . . . . 83
5.2. Mathematization; $\sigma$-classes and $\pi$-classes . . . . . 87
5.3. Applications . . . . . 92
5.4. The distortion of natural phenomena . . . . . 97
6. Topology . . . . . 99
6.1. Motivation; a medial view at a set . . . . . 99
6.2. Mathematization – equivalence of indiscernibility . . . 102
6.3. Historical intermezzo . . . . . 107
6.4. The nature of topological shapes . . . . . 109
6.5. Applications; invisible topological shapes . . . . . 111
7. Other sorts of classes and relations . . . . . 113
7.1. Revealed classes . . . . . 113
7.2. The generation of countable classes . . . . . 116
7.3. Cuts on natural numbers . . . . . 123
8. Synoptical indiscernibles . . . . . 125
8.1. The synoptic symmetry of indiscernibility . . . . . 125
8.2. The geometrical equivalence of indiscernibility . . . . 131
8.3. Real numbers . . . . . 134
9. Hierarchy of descriptive (well describable) classes . . . . . 139
9.1. Borel classes . . . . . 139
9.2. Analytic classes . . . . . 143
9.3. The hierarchy of projective classes . . . . . 146

**Part III. The Foundations of Infinitesimal Calculus 149**

1. Introduction . . . . . 151
2. The extension of the ancient geometrical world . . . . . 157
2.1. The classical geometric world . . . . . 157

2.2. The principles of expansion . . . . . 160
2.3. Infintely large and infinitely small real numbers . . . . 163
2.4. Infinite closeness . . . . . 166
2.5. The principles of backward projection . . . . . 167
2.6. Grid . . . . . 172
2.7. The Fourth Principle of Expansion . . . . . 174
2.8. $\mathcal{A}$-sequences . . . . . 176
3. Continuity and differentiability of real functions . . . . . 179
3.1. Continuity of a function at a point . . . . . 179
3.2. The derivative of a function at a point . . . . . 181
3.3. Functions continuous on a closed interval . . . . . 184
3.4. Increasing and decreasing functions . . . . . 187
3.5. Continuous bijective functions . . . . . 188
3.6. Inverse functions and their derivative . . . . . 189
3.7. Higher-order derivatives and analysis of graph of function at a point . . . . . 191
3.8. The limit of a function at a point . . . . . 194
3.9. Translation rules . . . . . 199
4. Integral of real function of one variable . . . . . 205
4.1. The initial problem of integral calculus and its solution 205
4.2. The integral of a real function over a complete grid . 209
4.3. Weakly bounded functions . . . . . 210
4.4. The primitive integral . . . . . 211
4.5. Uniformly weakly bounded $\mathcal{A}$-convergent sequences of functions . . . . . 213
4.6. Well-integrable functions . . . . . 217
4.7. General scholion . . . . . 218

Summary . . . . . 223

Literature . . . . . 227
