Contents

1 Origins I: From the arrow of time to the first quantum field 1
- 1.1 Quantum prehistory: crises in classical physics 1
- 1.2 Early work on cavity radiation 3
- 1.3 Planck's route to the quantization of energy 8
- 1.4 First inklings of field quantization: Einstein and energy fluctuations 14
- 1.5 The first true quantum field: Jordan and energy fluctuations 18

2 Origins II: Gestation and birth of interacting field theory: from Dirac to Shelter Island 30
- 2.1 Introducing interactions: Dirac and the beginnings of quantum electrodynamics 31
- 2.2 Completing the formalism for free fields: Jordan, Klein, Wigner, Pauli, and Heisenberg 40
- 2.3 Problems with interacting fields: infinite seas, divergent integrals, and renormalization 46

3 Dynamics I: The physical ingredients of quantum field theory: dynamics, symmetries, scales 57

4 Dynamics II: Quantum mechanical preliminaries 69
- 4.1 The canonical (operator) framework 70
- 4.2 The functional (path-integral) framework 86
- 4.3 Scattering theory 96
- 4.4 Problems 106

5 Dynamics III: Relativistic quantum mechanics 108
- 5.1 The Lorentz and Poincaré groups 108
- 5.2 Relativistic multi-particle states (without spin) 111
- 5.3 Relativistic multi-particle states (general spin) 114
- 5.4 How not to construct a relativistic quantum theory 121
- 5.5 A simple condition for Lorentz-invariant scattering 125
- 5.6 Problems 130

6 Dynamics IV: Aspects of locality: clustering, microcausality, and analyticity 132
- 6.1 Clustering and the smoothness of scattering amplitudes 133
- 6.2 Hamiltonians leading to clustering theories 138
- 6.3 Constructing clustering Hamiltonians: second quantization 144
- 6.4 Constructing a relativistic, clustering theory 149
- 6.5 Local fields, non-localizable particles! 159

6.6 From microcausality to analyticity 164
6.7 Problems 169

7 Dynamics V: Construction of local covariant fields 171
7.1 Constructing local, Lorentz-invariant Hamiltonians 171
7.2 Finite-dimensional representations of the homogeneous Lorentz group 173
7.3 Local covariant fields for massive particles of any spin: the Spin-Statistics theorem 177
7.4 Local covariant fields for spin-$\frac{1}{2}$ (spinor fields) 184
7.5 Local covariant fields for spin-1 (vector fields) 198
7.6 Some simple theories and processes 202
7.7 Problems 215

8 Dynamics VI: The classical limit of quantum fields 219
8.1 Complementarity issues for quantum fields 219
8.2 When is a quantum field "classical"? 223
8.3 Coherent states of a quantum field 228
8.4 Signs, stability, symmetry-breaking 234
8.5 Problems 238

9 Dynamics VII: Interacting fields: general aspects 240
9.1 Field theory in Heisenberg representation: heuristics 241
9.2 Field theory in Heisenberg representation: axiomatics 253
9.3 Asymptotic formalism I: the Haag–Ruelle scattering theory 268
9.4 Asymptotic formalism II: the Lehmann–Symanzik–Zimmermann (LSZ) theory 281
9.5 Spectral properties of field theory 289
9.6 General aspects of the particle–field connection 297
9.7 Problems 304

10 Dynamics VIII: Interacting fields: perturbative aspects 307
10.1 Perturbation theory in interaction picture and Wick's theorem 309
10.2 Feynman graphs and Feynman rules 314
10.3 Path-integral formulation of field theory 325
10.4 Graphical concepts: N-particle irreducibility 341
10.5 How to stop worrying about Haag's theorem 359
10.6 Problems 371

11 Dynamics IX: Interacting fields: non-perturbative aspects 374
11.1 On the (non-)convergence of perturbation theory 376
11.2 "Perturbatively non-perturbative" processes: threshhold bound states 386
11.3 "Essentially non-perturbative" processes: non-Borel-summability in field theory 400
11.4 Problems 411

12 Symmetries I: Continuous spacetime symmetry: why we need Lagrangians in field theory 414
12.1 The problem with derivatively coupled theories: seagulls, Schwinger terms, and T^* products 414
12.2 Canonical formalism in quantum field theory 416
12.3 General condition for Lorentz-invariant field theory 421
12.4 Noether's theorem, the stress-energy tensor, and all that stuff 426
12.5 Applications of Noether's theorem 431
12.6 Beyond Poincaré: supersymmetry and superfields 443
12.7 Problems 464

13 Symmetries II: Discrete spacetime symmetries 469
13.1 Parity properties of a general local covariant field 470
13.2 Charge-conjugation properties of a general local covariant field 474
13.3 Time-reversal properties of a general local covariant field 477
13.4 The TCP and Spin-Statistics theorems 478
13.5 Problems 485

14 Symmetries III: Global symmetries in field theory 487
14.1 Exact global symmetries are rare! 489
14.2 Spontaneous breaking of global symmetries: the Goldstone theorem 492
14.3 Spontaneous breaking of global symmetries: dynamical aspects 495
14.4 Problems 507

15 Symmetries IV: Local symmetries in field theory 509
15.1 Gauge symmetry: an example in particle mechanics 509
15.2 Constrained Hamiltonian systems 512
15.3 Abelian gauge theory as a constrained Hamiltonian system 519
15.4 Non-abelian gauge theory: construction and functional integral formulation 529
15.5 Explicit quantum-breaking of global symmetries: anomalies 544
15.6 Spontaneous symmetry-breaking in theories with a local gauge symmetry 552
15.7 Problems 565

16 Scales I: Scale sensitivity of field theory amplitudes and effective field theories 569
16.1 Scale separation as a precondition for theoretical science 570
16.2 General structure of local effective Lagrangians 571
16.3 Scaling properties of effective Lagrangians: relevant, marginal, and irrelevant operators 574
16.4 The renormalization group 581
16.5 Regularization methods in field theory 588
16.6 Effective field theories: a compendium 595
16.7 Problems 608

17 Scales II: Perturbatively renormalizable field theories 610
17.1 Weinberg's power-counting theorem and the divergence structure of Feynman integrals 613
17.2 Counterterms, subtractions, and perturbative renormalizability 629
17.3 Renormalization and symmetry 645
17.4 Renormalization group approach to renormalizability 652
17.5 Problems 660

18 Scales III: Short-distance structure of quantum field theory 662
18.1 Local composite operators in field theory 664
18.2 Factorizable structure of field theory amplitudes: the operator product expansion 679
18.3 Renormalization group equations for renormalized amplitudes 698
18.4 Problems 708

19 Scales IV: Long-distance structure of quantum field theory 712
19.1 The infrared catastrophe in unbroken abelian gauge theory 713
19.2 The Bloch–Nordsieck resolution 724
19.3 Unbroken non-abelian gauge theory: confinement 728
19.4 How confinement works: three-dimensional gauge theory 744
19.5 Problems 752

Appendix A The functional calculus 754

Appendix B Rates and cross-sections 756

Appendix C Majorana spinor algebra 761
