Preface	ix
Chapter 1	Introduction 1 <i>The physicists' world in 1895. New horizons. Pieter Zeeman. Joseph John Thomson. Wilhelm Conrad Röntgen.</i>
Chapter 2	H. Becquerel, the Curies, and the Discovery of Radioactivity 26 <i>Becquerel's "predestined" discovery. The Curies and a great leap forward.</i>
Chapter 3	Rutherford in the New World: The Transmutation of Elements 46 <i>Rutherford's early career. Investigations in radioactivity. Disciples and the discovery of transmutation.</i>
Chapter 4	Planck, Unwilling Revolutionary: The Idea of Quantization 61 <i>The theoretical pillars of physics. An encompassing problem: the blackbody. Max Planck.</i>
Chapter 5	Einstein—New Ways of Thinking: Space, Time, Relativity, and Quanta 78 <i>An unconventional youth. Relativity. Grains of light and molecular bits. From patent office to world fame. The world order collapses and space is curved. The later years and Einstein's solitude.</i>

- Chapter 6      Sir Ernest and Lord Rutherford  
of Nelson      101  
*Back to England. New light on alpha particles. The atomic nucleus. The planetary atom. Same but different: the concept of isotopism. The disintegration of the nucleus. Director of the Cavendish Laboratory.*
- Chapter 7      Bohr and Atomic Models      119  
*The young Bohr and the hydrogen atom. X-rays come into their own. The quantized atom established. Weimar and Copenhagen physics. The exclusion principle.*
- Chapter 8      A True Quantum Mechanics  
at Last      149  
*Louis de Broglie: matter waves. Werner Heisenberg and Wolfgang Pauli: magic matrices. Paul Adrien Maurice Dirac: abstraction and mathematical beauty. Erwin Schrödinger. The meaning of the equations. A new look at reality: complementarity. Mysteries explained, but doubts remain.*
- Chapter 9      The Wonder Year 1932: Neutron, Positron,  
Deuterium, and Other Discoveries      175  
*The discovery of the neutron. The discovery of deuterium. The positron. The new nuclear physics.*
- Chapter 10      Enrico Fermi and Nuclear Energy      200  
*Discoveries at Rome. The discovery of fission. The steps to the atomic bomb. Transuranic elements. Physics mobilized. Consequences of the bomb. Fermi's final work.*
- Chapter 11      E. O. Lawrence and Particle  
Accelerators      223  
*Large-scale physics. The first accelerators. Lawrence and the cyclotron. Policies and personalities. Racing for ever-higher energies.*

Chapter 12	Beyond the Nucleus	241
	<i>The elementary particles. The new science in Japan. Discovery of the pion. A horde of new particles. Antinucleons. The downfall of parity. The bubble chamber. Order in the wilderness.</i>	
Chapter 13	New Branches from the Old Stump	271
	<i>Quantum electrodynamics. Laser and maser. Nuclear physics. The Mössbauer effect. Superconductivity. Other macroscopic quantum effects. At the boundaries of physics: astrophysics, biology. The perplexed scientist.</i>	
Chapter 14	Conclusions	292
	<i>Future trends. The innards of physics.</i>	
Appendixes	1. Stefan's law. Wien's law	301
	2. Planck's hunt for the blackbody radiation formula	302
	3. Einstein's heuristic argument for postulating the existence of light quanta	304
	4. Brownian motion	306
	5. Blackbody energy fluctuations according to Einstein	308
	6. Specific heat of solids according to Einstein	310
	7. $A$ and $B$ of Einstein	311
	8. J. J. Thomson's parabola method for finding $e/m$ of ions	313
	9. Bohr's hydrogen atom	314
	10. Quantum mechanics in a nutshell	316
