Preface	ix
Notation	xi

I. KINETIC THEORY OF GASES

§ 1. The distribution function	1
§ 2. The principle of detailed balancing	4
§ 3. The Boltzmann transport equation	7
§ 4. The H theorem	11
§ 5. The change to macroscopic equations	13
§ 6. The transport equation for a slightly inhomogeneous gas	17
§ 7. Thermal conduction in the gas	21
§ 8. Viscosity in the gas	24
§ 9. Symmetry of the kinetic coefficients	26
§ 10. Approximate solution of the transport equation	30
§ 11. Diffusion of a light gas in a heavy gas	36
§ 12. Diffusion of a heavy gas in a light gas	40
§ 13. Transport phenomena in a gas in an external field	42
§ 14. Phenomena in slightly rarefied gases	48
§ 15. Phenomena in highly rarefied gases	56
§ 16. Dynamical derivation of the transport equation	67
§ 17. The transport equation including three-particle collisions	72
§ 18. The virial expansion of the kinetic coefficients	77
§ 19. Fluctuations of the distribution function in an equilibrium gas	79
§ 20. Fluctuations of the distribution function in a non-equilibrium gas	84

II. THE DIFFUSION APPROXIMATION

§ 21. The Fokker-Planck equation	89
§ 22. A weakly ionized gas in an electric field	93
§ 23. Fluctuations in a weakly ionized non-equilibrium gas	97
§ 24. Recombination and ionization	102
§ 25. Ambipolar diffusion	106
§ 26. Ion mobility in solutions of strong electrolytes	108

III. COLLISIONLESS PLASMAS

§ 27. The self-consistent field	115
§ 28. Spatial dispersion in plasmas	118
§ 29. The permittivity of a collisionless plasma	121
§ 30. Landau damping	124
§ 31. Permittivity of a Maxwellian plasma	128

§ 32. Longitudinal plasma waves	133
§ 33. Ion-sound waves	136
§ 34. Relaxation of the initial perturbation	138
§ 35. Plasma echoes	142
§ 36. Adiabatic electron capture	146
§ 37. Quasi-neutral plasmas	149
§ 38. Fluid theory for a two-temperature plasma	152
§ 39. Solitons in a weakly dispersing medium	154
§ 40. Permittivity of a degenerate collisionless plasma	161

IV. COLLISIONS IN PLASMAS

§ 41. The Landau collision integral	168
§ 42. Energy transfer between electrons and ions	173
§ 43. Mean free path of plasma particles	175
§ 44. Lorentzian plasmas	177
§ 45. Runaway electrons	181
§ 46. Convergent collision integrals	184
§ 47. Interaction via plasma waves	193
§ 48. Plasma absorption in the high-frequency limit	196
§ 49. Quasi-linear theory of Landau damping	199
§ 50. The transport equation for a relativistic plasma	205
§ 51. Fluctuations in plasmas	209

V. PLASMAS IN MAGNETIC FIELDS

§ 52. Permittivity of a collisionless cold plasma	217
§ 53. The distribution function in a magnetic field	220
§ 54. Permittivity of a magnetoactive Maxwellian plasma	224
§ 55. Landau damping in magnetoactive plasmas	226
§ 56. Electromagnetic waves in a magnetoactive cold plasma	231
§ 57. Effect of thermal motion on electromagnetic wave propagation in magnetoactive plasmas	238
§ 58. Equations of fluid dynamics in a magnetoactive plasma	241
§ 59. Transport coefficients of a plasma in a strong magnetic field	245
§ 60. The drift approximation	255

VI. INSTABILITY THEORY

§ 61. Beam instability	265
§ 62. Absolute and convective instabilities	268
§ 63. Amplification and non-transparency	273
§ 64. Instability with weak coupling of the two branches of the oscillation spectrum	276
§ 65. Instability in finite systems	281

VII. INSULATORS

§ 66. Interaction of phonons	284
§ 67. The transport equation for phonons in an insulator	288
§ 68. Thermal conduction in insulators. High temperatures	292
§ 69. Thermal conduction in insulators. Low temperatures	297
§ 70. Phonon scattering by impurities	301
§ 71. Phonon gas dynamics in insulators	302

§ 72. Sound absorption in insulators. Long waves	305
§ 73. Sound absorption in insulators. Short waves	309

VIII. QUANTUM LIQUIDS

§ 74. Transport equation for quasi-particles in a Fermi liquid	312
§ 75. Thermal conductivity and viscosity of a Fermi liquid	318
§ 76. Sound absorption in a Fermi liquid	320
§ 77. Transport equation for quasi-particles in a Bose liquid	324

IX. METALS

§ 78. Residual resistance	329
§ 79. Electron-phonon interaction	334
§ 80. Transport coefficients in metals. High temperatures	339
§ 81. Umklapp processes in metals	342
§ 82. Transport coefficients in metals. Low temperatures	346
§ 83. Electron diffusion on the Fermi surface	353
§ 84. Galvanomagnetic phenomena in strong fields. General theory	358
§ 85. Galvanomagnetic phenomena in strong fields. Particular cases	363
§ 86. Anomalous skin effect	368
§ 87. Skin effect in the infra-red range	376
§ 88. Helicon waves in metals	378
§ 89. Magnetoplasma waves in metals	381
§ 90. Quantum oscillations of the conductivity of metals in a magnetic field	383

X. THE DIAGRAM TECHNIQUE FOR NON-EQUILIBRIUM SYSTEMS

§ 91. The Matsubara susceptibility	391
§ 92. Green's functions for a non-equilibrium system	395
§ 93. The diagram technique for non-equilibrium systems	401
§ 94. Self-energy functions	404
§ 95. The transport equation in the diagram technique	408

XI. SUPERCONDUCTORS

§ 96. High-frequency properties of superconductors. General formula	413
§ 97. High-frequency properties of superconductors. Limiting cases	419
§ 98. Thermal conductivity of superconductors	424

XII. KINETICS OF PHASE TRANSITIONS

§ 99. Kinetics of first-order phase transitions. Nucleation	427
§ 100. Kinetics of first-order phase transitions. Coalescence	432
§ 101. Relaxation of the order parameter near a second-order phase transition	438
§ 102. Dynamical scale invariance	441
§ 103. Relaxation in liquid helium near the λ -point	443
