List of Abbreviations	5
Introduction	7
1 Theoretical background	9
1.1 Health and its prevention	9
1.2 Importance of physical activity in health prevention	11
1.3 Recommended amount and intensity of physical activity	13
1.4 Walking as the fundamental physical activity	15
1.5 Changes in lifestyle	17
1.6 Walking intervention models	18
1.7 Benefits of walking intervention programmes	19
1.7.1 Effect of regular walking on body composition parameters	20
1.7.2 Effect of regular walking on the development of bone tissue	22
1.7.3 Effect of regular walking on the level of postural stability	22
1.7.4 Effect of regular walking on muscle strength of the lower extremities	24
1.7.5 Effect of regular walking on the level of life satisfaction	24
1.8 30–35 minute 'brisk' walking to work as an intervention model to support habitual physical activity	25
1.9 Definition of the research issue	27
2 Study objectives	29
2.1 Partial objectives	29
2.2 Research hypotheses	29
3 Methods	31
3.1 Research sample	31
3.2 Study design	31
3.3 Physical activity intervention	32
3.4 Data collection	33
3.4.1 Physical activity monitoring	33
3.4.2 Body composition	34
3.4.3 Bone tissue density	34
3.4.4 Postural stability diagnostics	35
3.4.5 Diagnostics of bilateral isokinetic strength of knee extensors	35
3.4.6 Life satisfaction diagnostics	36
3.5 Statistical data processing	37
4 Results	39
4.1 Analysis of physical activity in study participants	39
4.2 Analysis of changed parameters of body composition	41
4.3 Analysis of changed parameters of bone tissue density	45

4.4	Analysis of changes in postural stability parameters	48
4.5	Analysis of parameter changes in bilateral isokinetic strength of the knee joint extensors	48
4.6	Analysis of changes in life satisfaction parameters	48
5	Discussion	51
5.1	Level and structure of physical activity in women with a sedentary occupation	51
5.2	Changes in body composition in women with a sedentary occupation as a result of a walking intervention to or from work	53
5.3	Walking to or from work and bone health	55
5.4	Walking to or from work and postural stability	56
5.5	Walking to or from work and bilateral isokinetic strength in the knee joint extensors	58
5.6	Walking to or from work and life satisfaction	60
5.7	Significance of walking to or from work	61
5.8	Study limitations	62
6	Conclusions	65
7	Key note messages	67
8	Summary	69
9	References	71
