Languages in Secondary Education: An Overview of National Tests in Europe – 2014/15	13
National tests in languages have become increasingly important across Europe over the last two decades	13
The majority of countries administer national tests in languages at both lower and upper secondary levels	15
The majority of national language tests carry high stakes for students	16
High-stakes tests results are often used as a basis for certification	17
The results of half of the low-stakes tests in languages are used at both school and education system levels	19
National tests in languages are mostly administered at the end of an educational level	21
About two thirds of all national tests in languages target all students but only around half are compulsory	22
Nearly all countries have developed at least one national test in English at secondary level	27
Almost half of the national tests in languages administered in Europe assess all four main skills	29
In the majority of countries, all national tests are linked to CEFR levels	31
In lower secondary education, CEFR levels A2 and B1 are usually the highest levels tested	33
In upper secondary education, the majority of national tests are not set above level B2	35
Of the national tests linked to CEFR, about half use its levels to report on student proficiency	37
Tests impacting on student progression are predominantly externally marked	38
Low-stakes tests used only at school level are often internally marked	42
