Abstract	5
Introduction	7
1 Current state of the problem	8
1.1 The importance and the processes of introduction	8
1.2 The most important periods and the content of introduction to woody plants in the world	9
1.3 Plant introduction process in Europe with emphasize to Slovakia (Czechoslovakia)	11
1.4 Phenology importance for climate change studies	16
1.5 Hardiness and physical stress in woody plants	18
1.6 Climate condition's effect on Mediterranean plants phenology	19
1.7 Plant metabolic as potential markers for assessment of adaptability to changed environment conditions	19
2 Scientific aims of the research	24
3 Materials and methods	25
3.1 The introduction processes database list of Mediterranean woody plant collection in chosen dendrological objects in Slovak Republic and Czech Republic	25
3.2 Mediterranean wood plants, short description which are used in experiment and the study plots scheme in Botanical Garden of the SUA Nitra	25
3.3 Woody plants phenology observation and growth processes assessment in the experimental plots of the SUA Botanical Garden	30
3.4 Adaptation processes assessment and investigation of woody plants hardiness	30
3.5 Experimental plots soil properties assessment from point of nutrient regime	31
3.6 Evaluation of the study area climate conditions in relation to methodology of the phenological observations	31
3.7 Carbohydrates and pigments content in the leaves of investigated woody plants as potential metabolic markers for adaptability assessment to changed environment conditions	37
3.8 Statistical data processing	34
4 Results and discussion	35
4.1 Geographic and climate assessment of the natural and introduction study areas	35
4.2 Some results of introduction processes and list of Mediterranean woody plants collection in chosen dendrological objects in Slovakia and Czech Republic	38
4.3 Adaptation processes, hardiness and the year increments evaluation of investigated woody plants	42
4.4 Phenology observation and growth processes assessment of woody plants in the experimental plots in the SUA Botanical garden	45
4.5 Soil properties assessment of the experimental plots from point of nutrient regime view	63
4.6 Content of carbohydrates, pigments and dry matters into leaves of investigated woody plants as potential metabolic markers for adaptability assessment of changed environment conditions	67
5 Conclusions	80
6 References	81
