

Advance Praise for

THE HISTORY AND PRACTICE  
OF ANCIENT ASTRONOMY

*"The History and Practice of Ancient Astronomy* is one of the most exciting and original books ever written on ancient, as well as medieval and Renaissance, astronomy, indeed, on the history of science. Here, for the first time, the reader can learn not only about ancient astronomy, but how to do ancient astronomy. The breadth of coverage is encyclopedic, from the Babylonians and Greeks, Ptolemy in particular, through Arabic astronomers of the middle ages, to Copernicus and Kepler. James Evans writes with an understanding and clarity that guides the reader through two thousand years of astronomy so that it is, as it were, brought back to life and can be understood as thoroughly as modern science. This is an ideal way to write the history of science and to learn the history of science."

—N. M. Swerdlow, Department of Astronomy  
and Astrophysics, University of Chicago

"Jim Evans combines a keen historical sense with a tinkerer's ingenuity and a gifted teacher's enthusiasm. His perceptive physical insights illuminate the intricacies of the early planetary theories. What I find particularly marvelous is the accuracy of his presentation (something remarkably hard to come by)."

—Owen Gingerich, Professor of Astronomy and  
History of Science, Harvard-Smithsonian  
Center for Astrophysics

## ONE

### The Birth of Astronomy

- 1.1 Astronomy around 700 B.C.: Texts from Two Cultures 3
- 1.2 Outline of the Western Astronomical Tradition 11
- 1.3 Observation: The Use of the Gnomon 27
- 1.4 On the Daily Motion of the Sun 27
- 1.5 Exercise: Interpreting a Shadow Plot 31
- 1.6 The Diurnal Rotation 31
- 1.7 Observation: The Diurnal Motion of the Stars 39
- 1.8 Stars and Constellations 39
- 1.9 Earth, Sun, and Moon 44
- 1.10 The Annual Motion of the Sun 53
- 1.11 Observation: The Motion of the Moon 58
- 1.12 The Uses of Shadows 59
- 1.13 Exercise: Using Shadow Plots 63
- 1.14 The Size of the Earth 63
- 1.15 Exercise: The Size of the Earth 66
- 1.16 Observation: The Angular Size of the Moon 67
- 1.17 Aristarchus on the Sizes and Distances 67
- 1.18 Exercise: The Sizes and Distances of the Sun and Moon 73

# ontents

## TWO

### The Celestial Sphere

- 2.1 The Sphere in Greek Astronomy 75
- 2.2 Sphaieropoia: A History of Sphere Making 78
- 2.3 Exercise: Using a Celestial Globe 85
- 2.4 Early Writers on the Sphere 87
- 2.5 Geminus: *Introduction to the Phenomena* 91
- 2.6 Risings of the Zodiac Constellations: Telling Time at Night 95
- 2.7 Exercise: Telling Time at Night 99
- 2.8 Observation: Telling Time at Night 99
- 2.9 Celestial Coordinates 99
- 2.10 Exercise: Using Celestial Coordinates 105
- 2.11 A Table of Obliquity 105
- 2.12 Exercise: Using the Table of Obliquity 109
- 2.13 The Risings of the Signs: A Table of Ascensions 109
- 2.14 Exercise: On Tables of Ascensions 120
- 2.15 Babylonian Arithmetical Methods in Greek Astronomy: Hypsicles on the Risings of the Signs 121
- 2.16 Exercise: Arithmetic Progressions and the Risings of the Signs 125
- 2.17 Observation: The Armillary Sphere as an Instrument of Observation 125

## THREE

### Some Applications of Spherics

- 3.1 Greek and Roman Sundials 129
- 3.2 Vitruvius on Sundials 132
- 3.3 Exercise: Making a Sundial 135
- 3.4 Exercise: Some Sleuthing with Sundials 140
- 3.5 The Astrolabe 141
- 3.6 Exercise: Using the Astrolabe 152

- 3.7 The Astrolabe in History 153
- 3.8 Exercise: Making a Latitude Plate for the Astrolabe 158

## FOUR

## Calendars and Time Reckoning

- 4.1 The Julian and Gregorian Calendars 163
- 4.2 Exercise: Using the Julian and Gregorian Calendars 170
- 4.3 Julian Day Number 171
- 4.4 Exercise: Using Julian Day Numbers 174
- 4.5 The Egyptian Calendar 175
- 4.6 Exercise: Using the Egyptian Calendar 181
- 4.7 Luni-Solar Calendars and Cycles 182
- 4.8 Exercise: Using the Nineteen-Year Cycle 188
- 4.9 The Theory of Star Phases 190
- 4.10 Exercise: On Star Phases 198
- 4.11 Some Greek Parapegmata 199
- 4.12 Exercise: On Parapegmata 204

## FIVE

## Solar Theory

- 5.1 Observations of the Sun 205
- 5.2 The Solar Theory of Hipparchus and Ptolemy 210
- 5.3 Realism and Instrumentalism in Greek Astronomy 216
- 5.4 Exercise: Finding the Solar Eccentricity 220
- 5.5 Rigorous Derivation of the Solar Eccentricity 221
- 5.6 Exercise: On the Solar Theory 223
- 5.7 Tables of the Sun 226
- 5.8 Exercise: On the Tables of the Sun 235
- 5.9 Corrections to Local Apparent Time 235
- 5.10 Exercise: Apparent, Mean, and Zone Time 243

## SIX

## The Fixed Stars

- 6.1 Precession 245
- 6.2 Aristotle, Hipparchus, and Ptolemy on the Fixedness of the Stars 247
- 6.3 Observation: Star Alignments 250
- 6.4 Ancient Methods for Measuring the Longitudes of Stars 250
- 6.5 Exercise: The Longitude of Spica 257
- 6.6 Hipparchus and Ptolemy on Precession 259
- 6.7 Exercise: The Precession Rate from Star Declinations 262
- 6.8 The Catalog of Stars 264
- 6.9 Trepidation: A Medieval Theory 274
- 6.10 Tycho Brahe and the Demise of Trepidation 281

## SEVEN

## Planetary Theory

- 7.1 The Planets 289
- 7.2 The Lower Planets: The Case of Mercury 299
- 7.3 Observation: Observing the Planets 301
- 7.4 The Upper Planets: The Case of Mars 302

- 7.5 Exercise: On the Oppositions of Jupiter 305
- 7.6 The Spheres of Eudoxus 305
- 7.7. The Birth of Prediction: Babylonian Goal-Year Texts 312
- 7.8 Exercise: On Goal-Year Texts 316
- 7.9 Babylonian Planetary Theory 317
- 7.10 Babylonian Theories of Jupiter 321
- 7.11 Exercise: Using the Babylonian Planetary Theory 334
- 7.12 Deferent-and-Epicycle Theory, I 337
- 7.13 Greek Planetary Theory between Apollonius and Ptolemy 342
- 7.14 Exercise: The Epicycle of Venus 347
- 7.15 A Cosmological Divertissement: The Order of the Planets 347
- 7.16 Exercise: Testing Apollonius's Theory of Longitudes 351
- 7.17 Deferent-and-Epicycle Theory, II: Ptolemy's Theory of Longitudes 355
- 7.18 Exercise: Testing Ptolemy's Theory of Longitudes 359
- 7.19 Determination of the Parameters of Mars 362
- 7.20 Exercise: Parameters of Jupiter 369
- 7.21 General Method for Planet Longitudes 369
- 7.22 Exercise: Calculating the Planets 372
- 7.23 Tables of Mars 372
- 7.24 Exercise: Using the Tables of Mars 384
- 7.25 Ptolemy's Cosmology 384
- 7.26 Astronomy and Cosmology in the Middle Ages 392
- 7.27 Planetary Equatoria 403
- 7.28 Exercise: Assembly and Use of Schönner's *Aequatorium Martis* 406
- 7.29 Geocentric and Heliocentric Planetary Theories 410
- 7.30 Nicholas Copernicus: The Earth a Planet 414
- 7.31 Kepler and the New Astronomy 427

#### Frequently Used Tables

- 2.1 Progress of the Sun through the Zodiac 96
- 2.2 The Length of the Night 97
- 2.3 Table of Obliquity 106
- 2.4 Table of Ascensions 110
- 4.1 Equivalent Dates in the Julian and Gregorian Calendars 169
- 4.2–4.4 Julian Day Number 172
- 4.5 Some Important Egyptian/Julian Equivalents 178
- 4.6 Months and Days of the Egyptian Year 178
- 5.1–5.3 Tables of the Sun 228
- 5.4 The Equation of Time 236
- 7.1 Planet Longitudes at Ten-Day Intervals 290
- 7.2 Oppositions of Mars, 1948–1984 303
- 7.4 Modern Ptolemaic Parameters for Venus, Mars, Jupiter, and Saturn 368
- 7.5–7.7 Tables of Mars 374
