CONTENTS

Preface xv

Chapter 1 Origins of the Quantum Theory 1

1. The Spectral Shape of Blackbody Radiation 2
2. The Photoelectric Effect 5
3. Line Spectra of Atoms 8
4. The Bohr-Rutherford Model of the One-Electron Atom 11
5. Wave-Particle Duality 15
6. The Uncertainty Principle 18

Chapter 2 The Schrödinger Wave Equation 21

1. Wave Mechanics 22
2. Probabilistic Interpretation of the Function Ψ 24
3. The Time-Independent Wave Equation 26
4. Vector Interpretation of Wavefunctions 30
5. Orthonormality of Wavefunctions 32
6. Hermitian Operators 36
7. Normal Operators 42
8. Expectation Values in Quantum Mechanics 44
9. Construction of Quantum Mechanical Operators 46
10. The Generalized Uncertainty Principle 48
11. Constants of the Motion 49
12. The Quantum Mechanical Virial Theorem 50

Chapter 3 The Quantum Mechanics of Some Simple Systems 53

1. Interaction of Matter and Radiation 53
2. The Free Particle 60
3. The Particle in a Box 62
4. Spectroscopy of the Particle in a Box 70
5. The Tunneling Effect 73
6 The Harmonic Oscillator 78
7. Spectroscopy of the Harmonic Oscillator 78

Chapter 4 Quantum Theory of Angular Momentum: The Rigid Rotator 90
1. Review of Classical Angular Momentum 90
2. Commutation Properties of the Angular Momentum Operators 92
3. Angular Momentum in Spherical Polar Coordinates 94
4. Ladder Operators for Angular Momentum 96
5. The Eigenvalues of $\hat{L}_z$ and $\hat{L}^2$ 98
6. The Simultaneous Eigenfunctions of $\hat{L}_z$ and $\hat{L}^2$ 101
7. The Spherical Harmonics in Real Form 105
8. Recurrence Relations for Legendre Polynomials and Associated Legendre Functions 108
9. The Rigid Rotator 109

Chapter 5 The Hydrogen Atom 117
1. Schrödinger Treatment of the One-Electron Atom 117
2. Wavefunctions of the One-Electron Atom 125
3. Selection Rules for One-Electron Atoms 137
4. Spin Angular Momentum in One-Electron Atoms: A Relativistic Effect 138
5. The Zeeman Effect 144

Chapter 6 Approximate Solutions to the Schrödinger Equation 147
1. The Variation Method 148
2. Atomic Units in Electronic Structure Calculations 155
3. The Schrödinger Equation for Many-Electron Atoms: The Mass-Polarization Effect 157
4. Examples of Variational Calculations 160
5. Basis Functions for Electronic Calculations 170
6. Scaling and the Virial Theorem 171
7. Perturbation Theory for Nondegenerate States 174
8. Perturbation Theory for Degenerate States 179
9. Examples of Perturbation Calculations 183

Chapter 7 Electron Spin and Many-Electron Systems 191
1. The Antisymmetry Principle 191
2. Spin Angular Momenta and Their Operators 193
3. The Orbital Approximation 197
4. Two-Electron Wavefunctions 203
5. The Helium Atom Revisited 210

Chapter 8 The Quantum States of Atoms 215
1. Orbital Angular Momenta in Many-Electron Atoms 215
2. Spin-Orbit Coupling in Many-Electron Atoms 220
3. Atomic Term Symbols 225
4. Energy-Level Diagrams for Atoms 234
5. Selection Rules in Many-Electron Atoms 235
6. The Zeeman Effect in Many-Electron Atoms 237

Chapter 9 The Algebra of Many-Electron Calculations 245
1. Construction of Determinantal Eigenfunctions of $\hat{S}^2$ 245
2. Manipulation of Determinants in Many-Electron Calculations 250
3. The Ground-State Energy of the Lithium Atom 255
4. The Method of Configuration Interaction 259
5. The Wavefunctions of the $1s^2 2s^2 2p^2$ Configuration of the Carbon Atom 264

Chapter 10 The Hartree-Fock Self-Consistent Field Method 269
1. The Generation of Optimized Orbitals 270
2. Koopmans' Theorem: The Physical Significance of Orbital Energies 278
3. Theoretical Basis of the Aufbau Principle 281
4. The Electron Correlation Energy 284
5. Introduction to Density Matrices 288
6. Density Matrix Analysis of the Hartree-Fock Approximation 295
7. Natural Orbitals 300
8. Roothaan's Equations: The Matrix Solution of the Hartree-Fock Equations 303
9. Open-Shell Hartree-Fock Calculations 306

Chapter 11 Introduction to Molecular Structure 308
1. The Born-Oppenheimer Approximation 309
2. Solution of the Nuclear Equation 314
3. Selection Rules for Molecular Electronic Transitions 322
4. Molecular Hartree-Fock Calculations 326

Chapter 12 The Electronic Structure of Linear Molecules 331
1. Electronic Transitions in Molecules 332
2. Summary of the MO-LCAO Approximation 336
3. The Hydrogen Molecule Ion, H_2^+ 340
4. Scaling and the Virial Theorem for Diatomic Molecules 350
5. The Hydrogen Molecule (Dihydrogen) 356
6. The Aufbau Principle for Homonuclear Diatomic Molecules 364
7. Heteronuclear Diatomic Molecules 375
8. Linear Polyatomic Molecules 381
9. Molecular Configuration-Interaction Calculations 388
10. The Valence Bond Method 394
11. Natural Orbital Analysis of Molecular Wavefunctions 397
12. Molecular Perturbation Calculations 400

Chapter 13 The Electronic Structure of Nonlinear Molecules 403
1. The AH_n molecules: Methane, Ammonia, and Water 404
2. Localized Molecular Orbitals 416
3. Hybrid Orbitals 423
4. The Ethylene and Benzene Molecules 427
5. Pseudo-potential Methods in MO Calculations on Large Molecules 437
6. Calculations on Transient and Experimentally Unobserved Species 444

Chapter 14 Semiempirical Molecular Orbital Methods I: Pi Electron Systems 454
1. Partial Electron-Shell Wavefunctions 454
2. The Hückel Approximation for Conjugated Hydrocarbons 455
3. HMO Calculations on Ethene and 1,3-Butadiene 462
4. HMO Treatment of Benzene 467
5. HMO Treatment of Heteronuclear Conjugated Systems 471
6. The Pariser-Parr-Pople Method 475
7. PPP Treatments of Ethene and Butadiene 480
8. Orthogonalized Basis Functions 485

Chapter 15 Semiempirical Molecular Orbital Methods II: All Valence-Electron Systems 491
1. The Extended Hückel Method 491
2. The CNDO Method 495
3. Between CNDO and *Ab Initio* 499
4. Qualitative Applications of MO Theory 502

Appendix 1 Values of Physical Constants 511

Appendix 2 Electrostatic and Electromagnetic Units 512

Appendix 3 Evaluation of Some Simple Helium Atom Integrals 514

Appendix 4 Vector and Operator Algebra 519
1. Vector Algebra 519
2. Operator Algebra 522

Appendix 5 Elements of Matrix Algebra 526
1. Elementary Properties of Matrices 526
2. Matrices as Transformation Operators 529
3. Determinants 530
4. Some Special Matrices and Their Properties 534
5. Linear Vector Spaces 537
6. Matrix Representation of Operators 540
7. Similarity Transformations 544
8. Projection Operators 547

Appendix 6 Molecular Symmetry 553
1. The Symmetry Elements of Molecules 554
2. The Concept of Groups 555
3. Irreducible and Reducible Representations of Point Groups 558
4. General Properties of Irreducible Representations 567
5. The Direct-Product Representation 569
6. Symmetry Projection-Operators 573
7. Symmetry and Molecular Spectra 576

Appendix 7 Character Tables for Some Common Molecular Point Groups 581
