

Contents

1	About the Course, and These Notes	1
1.1	Aims and prerequisites	1
1.2	Approach	2
1.3	A question a day	2
1.4	Homework	3
1.5	The name of the game	5
1.6	Other reading	5
1.7	Numeration; history; advice; web access; request for corrections	6
1.8	Acknowledgements	7
	Part I. Motivation and Examples	9
2	Making Some Things Precise	11
2.1	Generalities	11
2.2	What is a group?	11
2.3	Indexed sets	14
2.4	Arity	15
2.5	Group-theoretic terms	15
2.6	Evaluation	19
2.7	Terms in other families of operations	20
3	Free Groups	25
3.1	Motivation	25
3.2	The logician's approach: construction from group-theoretic terms	28
3.3	Free groups as subgroups of big enough direct products	32
3.4	The classical construction: free groups as groups of words	37

4	A Cook's Tour of Other Universal Constructions	45
4.1	The subgroup and normal subgroup of G generated by $S \subseteq G $	46
4.2	Imposing relations on a group. Quotient groups	47
4.3	Groups presented by generators and relations	49
4.4	Abelian groups, free abelian groups, and abelianizations	56
4.5	The Burnside problem	60
4.6	Products and coproducts of groups	62
4.7	Products and coproducts of abelian groups	69
4.8	Right and left universal properties	71
4.9	Tensor products	75
4.10	Monoids	79
4.11	Groups to monoids and back again	85
4.12	Associative and commutative rings	88
4.13	Coproducts and tensor products of rings	96
4.14	Boolean algebras and Boolean rings	100
4.15	Sets	104
4.16	Some algebraic structures we have not looked at	105
4.17	The Stone-Ćech compactification of a topological space	105
4.18	Universal covering spaces	113
	Part II. Basic Tools and Concepts	117
5	Ordered Sets, Induction, and the Axiom of Choice	119
5.1	Partially ordered sets	119
5.2	Digression: preorders	128
5.3	Induction, recursion, and chain conditions	133
5.4	The axioms of set theory	141
5.5	Well-ordered sets and ordinals	146
5.6	Zorn's Lemma	160
5.7	Some thoughts on set theory	168
6	Lattices, Closure Operators, and Galois Connections	173
6.1	Semilattices and lattices	173
6.2	0, 1, and completeness	183
6.3	Closure operators	194
6.4	Digression: a pattern of threes	201
6.5	Galois connections	205
7	Categories and Functors	213
7.1	What is a category?	213
7.2	Examples of categories	220
7.3	Other notations and viewpoints	228
7.4	Universes	232

7.5	Functors	238
7.6	Contravariant functors, and functors of several variables	247
7.7	Category-theoretic versions of some common mathematical notions: properties of morphisms	253
7.8	More categorical versions of common mathematical notions: special objects	262
7.9	Morphisms of functors (or “natural transformations”)	277
7.10	Properties of functor categories.....	287
7.11	Enriched categories (a sketch).....	291
8	Universal Constructions in Category-Theoretic Terms ...	295
8.1	Universality in terms of initial and terminal objects	295
8.2	Representable functors, and Yoneda’s Lemma	296
8.3	Adjoint functors.....	305
8.4	Number-theoretic interlude: the p -adic numbers and related constructions	317
8.5	Direct and inverse limits	323
8.6	Limits and colimits	334
8.7	What respects what?	342
8.8	Functors respecting limits and colimits	344
8.9	Interaction between limits and colimits	353
8.10	Some existence theorems	361
8.11	Morphisms involving adjunctions	368
8.12	Contravariant adjunctions	374
9	Varieties of Algebras	379
9.1	The category $\Omega\text{-Alg}$	379
9.2	Generating algebras from below	387
9.3	Terms and left universal constructions	391
9.4	Identities and varieties	399
9.5	Derived operations.....	411
9.6	Characterizing varieties and equational theories	415
9.7	Lie algebras.....	425
9.8	Some instructive trivialities	434
9.9	Clones and clonal theories	436
9.10	Structure and Semantics	449
Part III. More on Adjunctions.....		455
10	Algebra and Coalgebra Objects in Categories, and Functors Having Adjoints	457
10.1	An example: $SL(n)$	457
10.2	Algebra objects in a category	461
10.3	Coalgebra objects in a category	466
10.4	Freyd’s criterion for the existence of left adjoints	470
10.5	Some corollaries and examples	473

10.6	Representable endofunctors of Monoid	480
10.7	Functors to and from some related categories	491
10.8	Representable functors among categories of abelian groups and modules	495
10.9	More on modules: left adjoints of representable functors	499
10.10	Some general results on representable functors, mostly negative	506
10.11	A few ideas and techniques	510
10.12	Contravariant representable functors	514
10.13	More on commuting operations.....	522
10.14	Some further reading on representable functors, and on General Algebra	529
References		531
List of Exercises		539
Symbol Index.....		547
Word and Phrase Index		553
	<i>end</i>	572
