

1. Introduction	11	6.7.5 Seismic activity and the events of a regional character	64
2. Stress in the rock mass and the mechanism of rockburst formation	12	6.8 Use of the SP stations to assess the effects of rockbursts and seismicity on surface structures	64
2.1 Stress in the rock mass	12	6.9 Seismological Information System (SIS)	69
2.2 Current knowledge of stress fields in the OKR	14	7. The system and classification of measures and methods of rockburst prevention in the OKR	71
2.2.1 The results of the stress detection in the Karviná Partial Basin in the Czech part of the USCB	15	8. Prediction of rockburst occurrence in the OKR	75
2.2.2 Determining the orientation of the principal stress using the method of solving the mechanisms of the seismic event focal area	17	8.1 Regional rockburst prediction	75
2.3 Definitions, mechanisms and classifications of rockburst	18	8.1.1 The method of assessing the lithology layers sequence	75
2.4 Characteristics of rockbursts in longwalls and long mine workings	21	8.1.2 Assessment of the sedimentary conditions (depth of the deposition beneath the surface, thickness and dip of the layers)	78
3. The history of rockbursts in the OKR	23	8.1.3 Assessment of the tectonic structure of the rock mass	79
4. Geological and geomechanical conditions in the OKR	33	8.1.4 Assessment of physical and mechanical properties of the rock mass	82
4.1 The geological evolution of the Upper Silesian Coal Basin	33	8.2 Local and continuous rockburst prediction	87
4.2 Lithological structure and stratigraphy of the coal-bearing Carboniferous	37	8.2.1 Local rockburst prediction	87
4.3 Tectonic structure	38	8.2.2 Continuous rockburst prediction	92
4.4 Physical and mechanical properties of the rock mass	41	9. Rockburst measures applied in the OKR	96
5. Mining conditions in the OKR	45	9.1 Strategic methods	97
6. Seismicity and geophysical methods used in the OKR	46	9.1.1 Use of protective seams	97
6.1 Geophysical methods used in mining in the OKR	46	9.1.2 Minimizing the number of mine workings	97
6.1.1 Exploratory geophysical methods	46	9.1.3 Optimizing the size and shape of mine workings	98
6.1.2 Geophysical methods of verifying the stress state	47	9.1.4 Optimization of mining in terms of space and time	98
6.1.3 Geophysical methods and impacts of mining activities	47	9.1.5 Minimizing the number of remaining pillars and limiting their impact	99
6.2 The seismic and seismoacoustic method	47	9.2 Methods of tactical and operational rockburst prevention measures	100
6.3 The principles of seismic methods and evaluation of collected data	48	9.2.1 The choice of technology when mining	101
6.3.1 The basic principles of seismic methods	48	9.2.2 Destress drilling	101
6.3.2 Evaluation of seismic records	49	9.2.3 Destress blasting in the seam	104
6.3.3 Localization of seismic phenomena	51	9.2.4 Destress blasting in the accompanying seam rocks	106
6.3.4 Determining the energy of seismic phenomena	52	9.2.5 Pressure water infusion	111
6.4 The mechanism of seismic events arising from mining activities	52	9.2.6 Evaluation of the effectiveness of applied rockburst prevention measures	113
6.5 History of seismological monitoring in the OKR	54	9.2.7 Examples of rockburst prevention measures implemented in connection with rockbursts	115
6.6 Seismological monitoring by regional seismic networks	58	10. Tactics of rescue work when removing rockburst consequences	125
6.7 Geophysical methods in the rockburst prediction system	61	10.1 Specific risks associated with the rescue of miners and mitigating rockburst consequences	125
6.7.1 Seismoacoustic method	61	10.2 Risk reduction related to the control and elimination of rockburst consequences	126
6.7.2 Seismic load	61	11. Mining regulations relating to the issue of rockbursts in the OKR	130
6.7.3 Seismoacoustic testing	62		
6.7.4 Seismological method	63
