Key words: Granite, Geochemistry, Metallogeny, tinn deposits

Abstract

This paper briefly recapitulates the hitherto achieved geological, geophysical, geochemical and economic-geological data from the Nejdek massif. On the basis of statistical processing more than 200 chemical analyses there was the existence of 4 basic chemical types of granites established. On the basis of extensive economic-geological exploration a genetic model of the tin mineralization was set up.

Contents

1. Introduction (K.B.)	4
2. Geology (K.B.)	4
3. Geophysical image of the massif (L.P.)	6
4. Petrography of granitoids (M.K.)	10
5. Dyke rocks (K.B.)	14
6. Geochemistry (K.B.)	15
7. Rock forming minerals (M.K., K.B.)	19
8. Sn-W mineralization (K.B.)	19
9. Secondary geochemical and mineralogical field (K.B.)	21
10. Discussion of some metallogenic problems (K.B.)	24
