

Detailed Contents

Preface	v	2.5 Scattering of X-rays by crystalline solids: Bragg's law and the Bragg equation	29
About the Book	vi	2.6 The powder X-ray diffraction experimental method	31
About the Online Resource Centre	vii	2.6.1 Sources of X-rays	31
Acknowledgements	viii	2.6.2 Data collection	33
Acronyms and abbreviations	xv	2.6.3 Experimental methods	33
CHAPTER 1 Fundamental aspects of characterisation methods in inorganic chemistry			
1.1 Introduction	1	2.7 Applications of powder X-ray diffraction	35
1.2 Units and energy unit conversions	2	2.7.1 Phase identification	35
1.2.1 Units of distance and atomic separation	2	2.7.2 Forensic applications and phase identification of unknowns	36
1.2.2 Wavelength, frequency, and energy	2	2.7.3 Determination of phase purity, following reactions to completion, and phase diagrams	36
1.2.3 Electronvolts	2	2.7.4 Phase changes and thermal expansion	37
1.2.4 Wavenumbers	3	2.7.5 Quantitative analysis and quality control	38
1.2.5 NMR energy units	4	2.8 Powder X-ray diffraction data analysis	38
1.3 The electromagnetic spectrum and spectroscopy	4	2.8.1 Indexing powder diffraction patterns from cubic systems	38
1.3.1 The electromagnetic spectrum and transitions between energy levels in atoms	5	2.9 Lattice type and systematic absences	40
1.3.2 The generation of electromagnetic radiation	5	2.9.1 The origin of systematic absences	40
1.4 Timescales of characterisation methods	6	2.9.2 Indexing data from <i>I</i> - and <i>F</i> -centred lattices	41
1.4.1 Diffraction	6	2.10 Extracting simple structural information using PXD data from cubic materials	44
1.4.2 Spectroscopic methods	7	2.11 The single-crystal X-ray diffraction technique—introduction	45
1.4.3 Introduction to exchange processes	7	2.12 Reflection intensities and structure factors in X-ray diffraction	46
1.5 Fourier transforms in spectroscopy	9	2.13 Structure solution from single-crystal X-ray diffraction data	49
1.6 Experimental considerations—information, experimental times, and sample requirements	11	2.13.1 Obtaining suitable single crystals	49
1.6.1 Quantities required and experimental times	11	2.13.2 Instrumentation and collection of diffraction data	50
1.6.2 Sample form and recovery	11	2.14 Solving the structure from single-crystal diffraction data	50
1.6.3 Availability of instrumentation	11	2.14.1 The Patterson synthesis	51
1.6.4 Choosing a suitable technique	12	2.14.2 Direct methods	53
1.6.5 Research facilities and instrumentation	13	2.14.3 Completing the structure	53
1.7 Layout of the book	18	2.15 Crystallographic information from single-crystal X-ray diffraction	54
Problems	19	Problems	55
Bibliography	19	Advanced diffraction techniques	57
CHAPTER 2 Diffraction methods and crystallography			
Fundamentals 20			
2.1 Introduction to diffraction	20	2.16 Powder X-ray diffraction	57
2.2 Unit cells, lattices, and the description of crystal structures	21	2.16.1 Analysis of PXD data from tetragonal and hexagonal systems	57
2.3 Lattice planes and Miller indices	26	2.16.2 Crystallite size from PXD data	59
2.4 Relationship between Miller indices and <i>d</i> -spacing	28	2.16.3 Neutron powder diffraction	60
		2.16.4 PXD intensities and full diffraction profile analysis	62

2.17 Single-crystal diffraction	63	3.18 Advanced NMR techniques and experiments:	
2.17.1 Single-crystal neutron diffraction	63	INEPT and COSY	102
2.17.2 Electron density and X-n maps	63	3.18.1 INEPT	102
2.17.3 Amorphous materials, total diffraction, and pair distribution function analysis	64	3.18.2 COSY NMR spectra	103
		3.19 Solid-state NMR	105

Bibliography

65

CHAPTER 3 Nuclear magnetic resonance (NMR) spectroscopy

Fundamentals

66

3.1 Introduction to NMR spectroscopy	66
3.2 The basis of the NMR technique	67
3.2.1 Nuclear magnetic moments	67
3.2.2 Energy levels for NMR spectroscopy	71
3.2.3 Sensitivity of the NMR technique	72
3.2.4 Energy levels, frequencies, and the NMR nucleus	73
3.3 Experiment and instrumentation	74
3.4 Chemical shifts	75
3.5 Chemical shift and environment	77
3.6 Intensities	78
3.7 First-order spin–spin coupling or scalar coupling	79
3.7.1 Origins of spin–spin coupling	79
3.7.2 First-order spin–spin coupling for two heteronuclear $I = \frac{1}{2}$ nuclei	79
3.7.3 Spin–spin coupling nomenclature, coupling strengths, and interaction distances	81
3.7.4 First-order heteronuclear coupling in AX_n systems, $n > 1$	82
3.7.5 Homonuclear coupling	85
3.7.6 First-order coupling to spin $I > \frac{1}{2}$ nuclei	86
3.8 Magnitudes of coupling constants	87
3.9 Decoupling and decoupled spectra	88
3.10 Effects due to variations in natural abundance—isotopomers	90
3.11 Introduction to fluxionality	91

Problems

93

Advanced topics

94

3.12 Factors determining chemical shift	94
3.12.1 Oxidation state, molecular ion charge, and electronegativity	94
3.12.2 Coordination number	95
3.12.3 Other influences on chemical shift	95
3.13 Trends in coupling constants	95
3.14 Second-order coupling	96
3.15 Chemical and magnetic equivalence and inequivalence	97
3.16 Relaxation and relaxation times: quadrupolar nuclei in NMR	99
3.17 The NMR timescale, site exchange, and fluxionality	100

Bibliography

111

CHAPTER 4 Vibrational spectroscopy

Fundamentals

112

4.1 Introduction to vibrational spectroscopy	112
4.1.1 Underlying theory	112
4.1.2 Selection rules	113
4.1.3 Number of vibrational modes	114
4.1.4 Normal modes of vibration	114
4.2 Experimental considerations	115
4.2.1 IR spectrometers	115
4.2.2 Raman spectrometers	116
4.2.3 IR and Raman sampling	117
4.2.4 IR and Raman microscopy	119
4.3 Qualitative considerations	119
4.3.1 X–H groups and hydrogen bonds	119
4.3.2 Functional groups in organometallic complexes	120
4.3.3 IR data for common anions	121
4.3.4 Compounds and complexes containing oxo and nitrido groups	121
4.3.5 Complexes with halide ligands	122
4.3.6 Complexes with carbonyl ligands	122
4.3.7 Complexes with dinitrogen as a ligand	124
4.3.8 Complexes with dioxygen as a ligand	124
4.3.9 Complexes with nitrosyl ligands	125
4.3.10 Complexes with cyanide, cyanate, thiocyanate, and selenocyanate ligands	125
4.3.11 Complexes with nitrite ligands	125
4.4 Applications of group theory to vibrational spectroscopy	126
4.4.1 Symmetry operations and symmetry elements	126
4.4.2 Point groups	131
4.4.3 Determining point groups	131
4.4.4 Character tables	134
4.4.5 A more rigorous approach to selection rules	135
4.4.6 Intensities	136
4.4.7 Mutual exclusion principle	136
4.4.8 Reducible and irreducible representations	137
4.4.9 Determining reducible and irreducible representations for stretching modes, Γ_{str}	139
4.4.10 Checking calculations	142
4.4.11 Carbonyl and dinitrogen complexes	143

4.4.12 Analysis of metal carbonyl IR spectra	143
4.4.13 Analysis of all vibrational modes, Γ_{vib} , Γ_{str} , and Γ_{def}	146
4.4.14 Labelling and assigning of vibrational modes	150
Problems	151
Advanced topics in vibrational spectroscopy	152
4.5 Advanced topics in Raman spectroscopy	152
4.5.1 Applications of polarisation in Raman spectroscopy	152
4.5.2 Advanced Raman techniques	153
4.6 Advanced applications of group theory in vibrational spectroscopy	155
4.6.1 Direct products—application to overtones and combinations in vibrational spectroscopy	155
4.6.2 Direct products—application to selection rules	157
4.6.3 Descent of symmetry and correlation diagrams—application to calcite and aragonite IR spectra	157
4.6.4 Γ_{vib} for linear molecules	159
4.6.5 Fermi resonance	159
4.6.6 Projection operators and symmetry coordinates to visualise vibrational modes	160
Bibliography	162

CHAPTER 5 Electronic absorption and emission spectroscopy

Fundamentals	163
5.1 Introduction	163
5.2 Experimental UV-vis spectroscopy	164
5.3 Types of electronic transitions in inorganic compounds and complexes	167
5.4 Selection rules and absorption intensities in UV-vis spectroscopy	167
5.4.1 Spin selection rule	168
5.4.2 Dipole selection rules	168
5.4.3 Relaxation of selection rules	169
5.4.4 Typical UV-vis intensities in transition metal compounds	169
5.5 d–d electronic transitions in transition metal complexes	170
5.5.1 Common colours of transition metal complexes	170
5.5.2 d–d spectra of 3d element complexes	171
5.5.3 The spectrochemical series	177
5.6 Charge transfer transitions in transition metal complexes and compounds	179
5.6.1 Ligand to metal charge transfer (LMCT) transitions	179
5.6.2 Characterisation of pigments, semiconductors, and band gaps	181
5.6.3 Metal to ligand charge transfer (MLCT) transitions	182
5.6.4 Optical electronegativities	182

5.6.5 Intervalence (or metal to metal) charge transfer (IVCT) transitions	183
5.7 Intra-ligand transitions	184
5.8 Electronic transitions in other inorganic materials	184
5.9 f–f electronic transitions in lanthanides	184
Problems	185
Advanced topics	185
5.10 Configurations, terms, and levels	185
5.10.1 Hund's rules	187
5.10.2 Atomic terms for p^n , d^n , and f^n configurations	187
5.10.3 Ordering of levels with terms	188
5.11 Emission spectroscopy	188
5.12 Lanthanide emission spectra—atomic spectra in solution	189
5.12.1 Ligand-enhanced lanthanide luminescence	189
5.13 Advanced d–d spectroscopy	191
5.13.1 Octahedral and tetrahedral ground terms	191
5.13.2 Excited state terms	193
5.13.3 Racah parameters	194
5.13.4 Orgel diagrams	194
5.13.5 Tanabe–Sugano diagrams	196
5.13.6 Summary of the analysis of UV-vis spectra from first row transition metal ions	203
5.14 Nephelauxetic effect	203
Bibliography	205

CHAPTER 6 X-ray and photoelectron spectroscopy, electron microscopy, and energy dispersive analysis of X-rays

6.1 Introduction to photoelectron spectroscopy	206
6.2 X-ray photoelectron spectroscopy (XPS)	207
6.3 Techniques related to XPS	208
6.3.1 Electron spectroscopy for chemical analysis (ESCA)	208
6.3.2 Auger spectroscopy with X-ray excitation	209
6.4 Ultraviolet photoelectron spectroscopy (UPS)	209
6.4.1 Experimental considerations	210
6.4.2 UPS spectrum of CO	210
6.4.3 Applications of UPS	210
6.5 X-ray absorption spectroscopy	211
6.5.1 X-ray absorption measurements: absorption and relaxation processes	211
6.5.2 XANES	212
6.5.3 Pre-edge features	212
6.5.4 EXAFS	213
6.6 Introduction to electron microscopy and energy dispersive analysis of X-rays	216
6.7 Scanning electron microscopy (SEM)	217

6.7.1	Sample preparation and environmental SEM (ESEM)	218
6.7.2	EDAX and EDS	218
6.7.3	Auger spectroscopy in electron microscopy	219
6.8	Transmission electron microscopy (TEM)	219
6.8.1	TEM sample preparation and mounting	220
6.8.2	Bright field image	220
6.8.3	Diffraction in TEM	220
	Problems	221
	Bibliography	221

CHAPTER 7 Mass spectrometry, chemical, and thermal analysis techniques

7.1	Introduction: compositional and thermal analysis	222
7.2	Mass spectrometry of inorganic compounds	222
7.2.1	Experiment basis and instrumentation	222
7.2.2	Interpretation of mass spectral data from inorganic and organometallic compounds	224
7.2.3	Example applications in inorganic chemistry	226
7.2.4	Combined mass spectrometry analysis methods	227
7.3	CHN, sulfur, and oxygen analysis	228
7.4	Atomic absorption spectroscopy, flame emission spectroscopy, and flame photometry	229
7.4.1	Atomic absorption spectroscopy	229
7.4.2	Flame emission spectroscopy and flame photometry	230
7.4.3	ICP-MS	231
7.5	Thermal analysis	231
7.5.1	Thermogravimetric analysis	231
7.5.2	Differential thermal analysis and differential scanning calorimetry	232
7.5.3	Combined thermal analysis and mass spectrometry	233
7.5.4	Melting point apparatus and hot stage microscopes	234
7.5.5	Other thermal analysis methods	234
	Problems	235
	Bibliography	236

CHAPTER 8 Magnetism

8.1	Magnetometry	237
8.1.1	Magnetic moment instrumentation	237
8.1.2	Initial analysis of experimental magnetisation data	238
8.2	Interpretation of magnetic moment, μ_{eff} values	240
8.2.1	The spin-only formula	240

8.2.2	Qualitative treatment of orbital contributions and temperature-dependent paramagnetism	242
8.2.3	Spin-crossover complexes and temperature-independent paramagnetism (TIP)	243
8.2.4	Orbital contributions to magnetic moments	243
8.3	Cooperative magnetism	248
	Problems	249
	Bibliography	250

CHAPTER 9 Electron paramagnetic resonance (EPR) spectroscopy

9.1	Introduction to EPR spectroscopy	251
9.2	Experimental considerations for EPR spectroscopy	251
9.3	Information available from EPR spectra	252
9.3.1	The g -value	252
9.3.2	Hyperfine coupling constant, A	256
9.4	Limitations of EPR spectroscopy	258
9.5	Applications of EPR spectroscopy	259
9.5.1	Main group examples	259
9.5.2	Transition metal examples	259
9.5.3	$S > \frac{1}{2}$ systems	263
	Problems	263
	Bibliography	265

CHAPTER 10 Mössbauer spectroscopy and nuclear quadrupole resonance (NQR) spectroscopy

10.1	Mössbauer spectroscopy	266
10.1.1	Introduction to Mössbauer spectroscopy	266
10.1.2	Experimental requirements for Mössbauer spectroscopy	266
10.1.3	Information available from Mössbauer spectra	268
10.1.4	Elemental range in Mössbauer spectroscopy	274
10.1.5	Applications of Mössbauer spectroscopy to elements other than iron	275
10.2	Nuclear quadrupole resonance (NQR) spectroscopy	276
10.2.1	Introduction to NQR spectroscopy	276
10.2.2	Experimental considerations for NQR spectroscopy	276
10.2.3	Underlying NQR theory	276
10.2.4	Information determined from NQR spectra	277
10.2.5	Range of elements for, and limitations of, NQR spectroscopy	278

10.2.6 Analysis of NQR data 278

Problems 279

Bibliography 281

CHAPTER 11 Characterisation of inorganic compounds: example problems with multiple techniques

Problem 11.1 Multinuclear NMR spectroscopy and mass spectrometry 282

Problem 11.2 Powder X-ray diffraction and multinuclear NMR 283

Problem 11.3 Electronic spectroscopy and magnetism 284

Problem 11.4 UV-vis spectroscopy and magnetism 285

Problem 11.5 Powder X-ray diffraction and thermal analysis/mass spectrometry 286

Problem 11.6 IR spectroscopy and chemical composition analysis 287

Problem 11.7 Elemental analysis, IR and Raman spectroscopy, EPR spectroscopy, and magnetic data 288

Problem 11.8 Crystallography, EPR, EXAFS, and technique timescales 288

Problem 11.9 Mössbauer spectroscopy, magnetic moments, and electronic absorption spectroscopy 289

Problem 11.10 Multinuclear NMR, IR and Raman spectroscopies, and main group chemistry 289

Appendix 1 Character tables 293

Appendix 2 Table of direct products 299

Appendix 3 Correlation tables 301

Appendix 4 Tanabe–Sugano diagrams and Lever plots 305

Index 311

Formula index 317
