<i>Preface</i>	vii
<i>Acknowledgments</i>	xi
<i>Acronyms</i>	xvii
<i>Symbols and Notations</i>	xix
1. Preliminaries of Quantum-State Estimation	1
1.1 Overview of quantum-state estimation	1
1.2 Basic aspects of estimation theory	5
1.2.1 Cost functions	5
1.2.1.1 Cost for Bayesian-mean estimation	7
1.2.1.2 Cost for maximum-likelihood (ML) estimation	12
1.2.2 Superoperators	14
1.2.2.1 Formalism	14
1.2.2.2 Dual operators and quantum-state estimation	16
1.2.2.3 Symmetric informationally complete measurements	20
1.2.3 A simple ML estimator for minimally complete measurements	22
1.2.4 Linear inversion	23
1.2.4.1 Minimally complete measurements	23
1.2.4.2 Arbitrary measurements — with emphasis on overcomplete ones	27
1.2.5 Geometry of the quantum state space	31

1.3	Uncertainties and information	33
1.3.1	Cramér–Rao limit for unbiased quantum-state estimation	33
1.3.2	Asymptotic efficiency	38
	Further reading	39
2.	Informationally Complete Estimation	41
2.1	ML scheme — perfect detections	41
2.1.1	A brief recap on basic concepts	41
2.1.2	The extremal equations	43
2.1.3	A simple example with the von Neumann measurement — first digression	46
2.1.4	Solution to the extremal equations	49
2.1.4.1	Operator calculus	49
2.1.4.2	Complex vector calculus — second digression	51
2.1.4.3	Operator calculus revisited — a steepest-ascent algorithm	54
2.2	Generalized ML scheme — imperfect detections	56
2.2.1	Imperfect measurements	56
2.2.2	ML estimation of the unknown number of copies	57
2.2.3	The extremal probabilities	63
2.2.4	Statistical consistency of the generalized ML estimator	64
2.2.5	A steepest-ascent algorithm	66
2.3	Another way of accounting for imperfections	67
2.4	Bayesian-mean estimation — some brief statements	70
	Further reading	73
3.	Informationally Incomplete Estimation	75
3.1	Likelihood and entropy — perfect detections	75
3.1.1	Informationally incomplete measurements	75
3.1.2	Properties of ML convex sets	76
3.1.3	Measurement-subspace decomposition	80
3.1.4	Maximum-likelihood–maximum-entropy (MLME) method	83
3.1.4.1	The von Neumann entropy	83
3.1.4.2	The maximum-entropy estimator	84

3.1.4.3	The extremal equations	85
3.1.4.4	A steepest-ascent algorithm	87
3.1.4.5	Simple closed-form expressions	88
3.2	Likelihood and entropy — imperfect detections	90
3.2.1	The extremal probabilities	90
3.2.2	Multiple ML convex sets	91
3.2.3	A steepest-ascent algorithm	92
3.3	An easy trick for constrained function optimization	94
3.4	Some remarks	97
	Further reading	99
4.	Practical Aspects of State Estimation	101
4.1	Accuracy of unbiased state estimation	101
4.2	Experimental schemes	111
4.2.1	Discrete-variable measurements — photon polarization	112
4.2.1.1	Six-outcome measurement	112
4.2.1.2	Trine measurement	114
4.2.1.3	Tetrahedron measurement	116
4.2.2	Discrete-variable measurements — photon counting and its difficulties	119
4.2.2.1	Photon-number statistics	119
4.2.2.2	Characteristic functions	119
4.2.2.3	The physics of photodetection	121
4.2.2.4	Indirect photon counting	126
4.2.3	Continuous-variable measurements	130
4.2.3.1	Displaced Fock-state measurement	130
4.2.3.2	Quadrature-eigenstate measurement	140
	Further reading	154
5.	Quasi-Probability Distributions	155
5.1	Distribution functions	155
5.1.1	Wigner function	156
5.1.1.1	Definitions and properties	156
5.1.1.2	Quadrature eigenstates	162
5.1.1.3	Coherent states	165
5.1.1.4	Odd and even coherent states	166
5.1.1.5	Fock states	168

5.1.2	Glauber-Sudarshan P function	175
5.1.2.1	Definitions and properties	175
5.1.2.2	Coherent states	179
5.1.2.3	Odd and even coherent states	180
5.1.2.4	Fock states	183
5.1.3	Husimi Q function	189
5.2	Connections among quasi-probability distribution functions	190
5.2.1	Formalism	190
5.2.2	Applications	194
5.3	An equivalence theorem and generalized quasi-probability distributions	201
	Further reading	207
	Hints to All Problems	209
	Sample Solutions to All Problems	221
	Appendix: Squeezed Coherent States	311
	<i>Index</i>	319
