Preface to the first edition *page v*

Preface to the second edition *vii*

Protocols list *xiii*

Abbreviations *xvii*

1 Strategies for research in molecular biology 1

T. A. Brown

- 1 Introduction 1
- 2 Strategies for gene isolation 1
 - Different approaches to gene isolation by cloning 2
 - Identifying a gene in a gene library 5
- 3 Studying gene structure and expression 10
 - Nucleic acid labelling 10
 - Hybridization analysis 10
 - DNA sequencing 11
 - PCR 12
 - Studies of gene expression 12
- 4 Interpretation of molecular biology experiments 12
 - References 13

2 Construction of genomic libraries in λ and cosmid vectors 15

Anna-Maria Frischauf

- 1 Introduction 15
- 2 Overview of library construction 16
- 3 Representation 17
- 4 The choice between λ and cosmid libraries 19
- 5 Vectors 19
- 6 Library construction 20
 - Phage λ vector preparation 20
 - Cosmid vector preparation 23
 - Partial digestion of DNA 24
 - The choice between size-fractionation and alkaline phosphatase treatment 26
 - Alkaline phosphatase treatment 27
 - Size-fractionation 28

CONTENTS

Ligation of insert DNA to the vector	30
<i>In vitro</i> packaging	31
Plating and amplification	34
References	39

3 Construction of a cDNA library 41

Madan K. Bhattacharyya

1 Introduction	41
2 Isolation of total RNA	43
3 Preparation of poly(A ⁺) RNA	44
4 cDNA synthesis	46
5 Preparation of cDNA for cloning	48
6 Establishment of the cDNA library	55
7 Characterization of the cDNA library	59
8 Amplification and storage of the cDNA library	61
References	62

4 Nucleic acid labelling and detection 63

C. R. Mundy, M. W. Cunningham and C. A. Read

1 Introduction	63
Applications of nucleic acid labelling	63
Sensitivity and resolution	64
Types of labels	64
2 Radioactive labelling and detection	69
Labelling and detection strategies	69
Practical considerations	72
Methods for uniform labelling of DNA and RNA	76
Methods for end-labelling	85
Detection of radioactively-labelled DNA and RNA	92
3 Non-radioactive labelling and detection methods	101
Biotin as a label for nucleic acids	101
Labelling with digoxigenin	105
Fluorescent labelling	105
Direct enzyme labelling with horseradish peroxidase	106
References	106

5 Immobilization of nucleic acids and hybridization analysis 109

N. J. Dyson

1 Introduction	109
2 Immobilization of nucleic acids on filters	109
Types of filter	109
Choice of filter	111
Characteristics of filter matrices	112
Dot blots	116
Preparation of plaque and colony replicas on nitrocellulose	120
Southern blotting	124
Northern blotting	132

3	Hybridization analysis of immobilized nucleic acids	133
	Hybridization theory	133
	Factors affecting the T_m	134
	Factors influencing the rate of hybridization	135
	Filter hybridization	138
	Hybridization of a Southern blot on a nitrocellulose filter	141
	Hybridization of nylon membranes	144
	Alternative or additional blocking agents	144
	Hybridization with RNA probes	144
	Hybridization to RNA dot-blot and northern blots	145
	Hybridization to colony or plaque replica filters	145
	Hybridization with oligonucleotide probes	146
	Hybridization in tetramethylammonium chloride	147
	Quantification of the hybridization signal	147
	Removal of probe and rehybridization of filters	147
	Calibration of UV transilluminators	149
	Autoradiography	149
	Determination of T_m for filter hybridization	149
	Troubleshooting guide	150
4	Advanced hybridization techniques	151
	<i>In situ</i> hybridization to detect RNA transcripts in tissue sections	151
	<i>In situ</i> hybridization of chromosomes	151
	Microarray and chip technologies	154
	References	154
6	DNA sequencing	157
	<i>T. A. Brown</i>	
1	Introduction	157
2	Preparation of template DNA	158
	Preparation of single-stranded DNA from M13 clones	158
	Preparation of template DNA from double-stranded plasmid clones	163
3	The sequencing reactions	166
	Components of a chain-termination sequencing reaction	166
	Sequencing reactions with Sequenase	168
4	Gel electrophoresis and autoradiography	172
	Denaturing polyacrylamide gel electrophoresis	172
	Autoradiography	177
	Troubleshooting	179
5	Building a long contiguous sequence	179
	Subcloning fragments of a long insert	179
	Methods for progressively building up a contiguous sequence	183
6	Automated DNA sequencing	183
7	DNA sequence storage and analysis	184
	References	185
7	The polymerase chain reaction	187
	<i>T. A. Brown</i>	
1	Introduction	187
2	Methodology for PCR	187

CONTENTS

A summary of PCR	187
Planning and carrying out a PCR	189
3 Cloning PCR products	201
4 Sequencing PCR products	203
Direct sequencing of PCR products	203
Thermal cycle sequencing of other DNA templates	207
5 Problems with PCR	207
References	207
8 Protein expression in <i>Escherichia coli</i>	209
<i>John M. Ward</i>	
1 Introduction	209
2 Factors affecting protein expression	209
Promoters	210
Translation initiation	211
3 Protein fusion systems	211
Histidine-tailed protein fusions	213
GST protein fusions	215
Cleavage of a GST fusion protein	216
4 Expression of proteins in the periplasm	217
5 Cofactor requirements	219
6 Problems when scaling up expression	219
References	220
9 Transcript mapping	223
<i>Colin P. Smith</i>	
1 Introduction	223
Northern analysis versus nuclease protection mapping	224
2 Mapping by nuclease protection	226
Standard nuclease S1 mapping	226
Choice of probe in nuclease protection mapping	229
Mapping of intron boundaries	233
Modifications to the standard nuclease S1 mapping protocol	236
Ribonuclease protection mapping	236
3 Primer-extension mapping	239
References	242
A1 Health hazards and safety procedures	245
A2 Equipment for molecular biology research	251
A3 Important <i>Escherichia coli</i> strains	255
A4 Recipes and general procedures	261
A5 Restriction endonucleases	267
A6 DNA and RNA modification enzymes	275
A7 List of suppliers	279
Index	285
