

CONTENTS

Introduction

- Operational quantum logic: An overview
By Bob Coecke, David Moore and Alexander Wilce p. 1

I. Algebras

- Algebraic aspects of orthomodular lattices
By Gunter Bruns and John Harding p. 37
- Observables in the logico-algebraic approach
By Pavel Pták p. 67
- Test spaces and orthoalgebras
By Alexander Wilce p. 81
- Representations on unigroups
By David J. Foulis p. 115
- Free extensions of group actions, induced representations,
and the foundations of physics
By David J. Foulis and Alexander Wilce p. 139

II. Categories

- Short introduction to enriched categories
By Francis Borceux and Isar Stubbe p. 167
- Operational Galois adjunctions
By Bob Coecke and David Moore p. 195
- Operational axiomatics and compound systems
By Frank Valckenborgh p. 219
- Quantales
By Jan Paseka and Jiří Rosický p. 245

III. Languages

- Quantales and observational semantics
By Pedro Resende p. 263
- Quantum languages
By Stan Gudder p. 289

Indices

- Concept index p. 311
- Citation index p. 317
