

Contents

1	The shore environment	1
1.1	Coastlines: from rocky shores to mangrove swamps	1
1.2	Rocky shores: from waveswept cliffs to sheltered sea loughs	2
1.3	Variations in conditions with height: the generation of a vertical gradient	5
1.3.1	Tides and changing conditions: 'emersion' and 'submersion'	5
1.3.2	Daily tidal patterns: the 'classic' case	7
1.3.3	Daily tidal patterns: variations with latitude and tidal basins	8
1.3.4	Variations in tides over the lunar month	8
1.3.5	Variations in tides over the seasons	9
1.3.6	Tidal predictions and tidal terminology	10
1.3.7	Effects on biological communities	11
1.4	How important is wave action? The generation of a horizontal gradient	13
1.4.1	Waves and what is meant by 'exposure'	14
1.4.2	Variation in exposure: rates of water flow, acceleration forces, and wave impact	14
1.4.3	Variation in exposure: seasons and pulse events	15
1.4.4	Effects on biological communities	16
2	The diversity of shore organisms	17
2.1	Biodiversity: what lives on the shore?	17
2.1.1	The variety of rocky shore organisms	17
2.1.2	Latitudinal changes	19
2.1.3	The concept of functional groups	20
2.2	Primary producers	22
2.2.1	Microscopic forms: the microalgae	22
2.2.2	Simple forms: filamentous, foliose, and corticated foliose algae	23
2.2.3	Complex forms: the corticated, leathery, and calcareous algae	24

2.2.4	Encrusting forms: the crustose algae	24
2.3	Grazers	25
2.3.1	The sweepers: topshells and nerites	25
2.3.2	The rakers: winkles, isopods, amphipods, and grapsid crabs	26
2.3.3	The diggers and abraders: limpets, chitons, and sea urchins	27
2.3.4	The biters and cutters: fish and majid crabs	29
2.4	Suspension feeders	30
2.4.1	The individual approach: mussels, barnacles, and solitary ascidians	30
2.4.2	The colonial approach: polychaetes, bryozoans, sponges, and ascidians	31
2.5	Predators	32
2.5.1	Borers and drillers: the whelks	33
2.5.2	Crushers and crackers: the crabs	33
2.5.3	External digesters: the starfish	34
2.5.4	Animal browsers or partial predators: the nudibranch molluscs	35
2.5.5	Mobile vertebrate predators: fish and birds	36
2.5.6	Sit and wait: the hydroids and anemones	36
2.5.7	Parasites: internal and external approaches	37
2.6	Functional groups around the world	37
3	Coping with life on the shore: adaptations of littoral organisms	38
3.1	How do rocky shore organisms cope with temperature changes and desiccation?	38
3.1.1	Behavioural adaptations: settlement, hiding, and migration	38
3.1.2	Physical adaptations: the advantages of shells	41
3.1.3	Physiological adaptations: how to combat water loss while still breathing	43
3.1.4	Biochemical adaptations: desiccation tolerance, cold hardening, and heat stress	44
3.2	How do rocky shore organisms cope with waves and currents?	47
3.2.1	Behavioural adaptations: hiding and living in the boundary layer	48
3.2.2	Physical adaptations: attachment, shape, and size	50
3.2.3	Physiological adaptations: growth strategies and life cycles	54
3.3	How do rocky shore organisms maintain their populations? An introduction to life-history strategies	55

3.3.1	Solitary vs. colonial forms	55
3.3.2	Reproductive types: sexual and asexual reproduction on the shore	56
3.3.3	Benthic vs. pelagic life cycles	57
3.3.4	Supply-side ecology and links with oceanographic processes	60
3.3.5	Recruitment	61
3.4	Reproductive strategies of producers	62
3.4.1	Sex, gametes, and pheromones	62
3.4.2	How many life-history phases: one, two, or three?	63
3.4.3	Strict cycling vs. variants	65
3.4.4	Microalgal reproduction	65
3.5	Reproductive strategies of consumers	66
3.5.1	Available options: a reproductive mosaic	66
3.5.2	Sex: males, females, or hermaphrodites?	67
3.5.3	External vs. internal fertilization, and the compromise options	67
3.5.4	Planktonic larvae: to feed or not to feed?	69
3.5.5	Eliminating the larval stage: benthic eggs and direct development	71
3.5.6	Parental care: brooding eggs or brooding larvae?	71
3.5.7	An alternative strategy: asexual reproduction	73
4	Primary producers on the shore: the autotrophs	75
4.1	Universality of autotrophs on rocky shores	75
4.1.1	Diversity of autotrophs	75
4.1.2	Diversity of forms	76
4.2	Distributions	81
4.2.1	Temperate vs. tropical	81
4.2.2	Local: sheltered vs. exposed	84
4.2.3	What controls small-scale spatial distribution?	86
4.2.4	Succession: what controls distribution in time?	89
4.3	Autotrophs as habitats	90
4.3.1	Macroalgae as forest equivalents: the importance of the canopy	90
4.3.2	Epiphytes	92
4.4	Autotrophic production	93
4.5	Autotrophs as food sources	95
4.5.1	Food quality and quantity	95
4.5.2	Macroalgae: chemical and physical defences against grazers	95
4.5.3	Microalgae and cyanobacteria	99
4.5.4	Breakdown: autotrophs as sources of detritus	100

5 Utilizing autotrophic resources: the grazers	102
5.1 Grazers and their food supply	102
5.1.1 Feeding mechanisms	102
5.1.2 Finding a food supply: grazer–algae relationships	106
5.1.3 Culturing a food supply: how to garden	109
5.2 Behaviour of grazers	110
5.2.1 Finding your own level	110
5.2.2 When to forage	111
5.2.3 How to avoid predators	114
5.2.4 How to get home	116
5.3 What controls distribution and population density of grazers?	118
5.3.1 Fecundity, recruitment, and growth	118
5.3.2 Effects of physical stress	120
5.3.3 Biological interactions	121
5.4 The effects of grazers	125
5.4.1 Macrograzers	125
5.4.2 Mesograzers	130
6 Suspension feeders: how to live on floating food	134
6.1 Occupying space	134
6.1.1 Spatial dominance on the shore	134
6.2 The problems of sitting still: how to be sessile	135
6.2.1 Feeding in relation to water flow	135
6.2.2 The variety of suspension-feeding mechanisms	137
6.3 Getting nourishment: a variety of food supplies	138
6.4 From larva to adult	139
6.4.1 Settling on hard substrates	139
6.4.2 Settlement on seaweeds	141
6.4.3 Metamorphosis, survival, and growth	143
6.5 What controls distribution and density of suspension feeders?	147
6.5.1 Recruitment and post-settlement mortality	147
6.5.2 Environmental effects on adults	149
6.5.3 Distribution and climate	150
6.5.4 Effects of predators	152
6.5.5 Anti-predator defences	154
6.5.6 Effects of competition	155
6.5.7 Effects of habitat modification and facilitation	157
6.5.8 Interactions between physical and biological effects	157
6.6 The effects of suspension feeders	159
7 Eating flesh: the predators	161
7.1 Food and feeding	161

7.1.1	Feeding mechanisms: a diversity of invertebrates	161
7.1.2	Feeding mechanisms: the mobile vertebrates	164
7.1.3	Foraging strategy	167
7.1.4	The parasitic approach and disease	170
7.2	Behaviour	171
7.2.1	Movement	171
7.2.2	Activity patterns	172
7.2.3	Defence	173
7.2.4	Aggressive behaviour in sessile predators	175
7.3	What controls population density, distribution, and morphology of predators?	177
7.3.1	Recruitment	177
7.3.2	Physical influences and predation effects	178
7.3.3	Direct effects of predators on predators	180
7.4	The effects of predators	180
7.4.1	Slow-moving predators: whelks and starfish	180
7.4.2	Mobile predators: crabs and vertebrates	183
7.4.3	Predators of sea urchins	185
7.4.4	Effects of parasites and disease	186
8	Vertical distributions: 'zonation' and its causes	187
8.1	Patterns of vertical zonation	187
8.1.1	Exposed shores	187
8.1.2	Sheltered shores	190
8.1.3	Moderately exposed shores	190
8.1.4	How real are 'zones'?	191
8.2	The influence of physical factors on vertical distributions	194
8.2.1	Direct physical effects	194
8.2.2	Is there a physical basis for 'zones'?	197
8.3	The influences of biological interactions on zonation	198
8.3.1	Larval settlement and post-settlement mortality	198
8.3.2	Competition	200
8.3.3	Predation	201
8.3.4	Grazing	202
8.3.5	Behaviour	203
8.4	What causes zonation? The relative influences of biological and physical factors	204
9	How organisms are gathered together: communities on the shore and the effects of wave exposure	207
9.1	Communities in relation to wave exposure	207
9.1.1	The composition of communities	207
9.1.2	The vertical range of communities	212

9.2	Explanations of the effects of wave exposure	213
9.2.1	The importance of wave forces	213
9.2.2	The importance of interactions between species	216
9.2.3	Conclusions: why are communities on exposed and sheltered shores different?	218
9.3	Factors other than exposure: the communities of special habitats	220
9.3.1	Tidal rapids and the effects of turbulent currents	220
9.3.2	Tide pools and the effects of constant submersion	223
9.3.3	Sea caves and the effects of reduced illumination	226
9.3.4	Estuarine shores and the effects of reduced salinity	227
10	The functioning of rocky-shore communities	232
10.1	Food chains and food webs	232
10.2	Stability on the shore	235
10.2.1	Sheltered shores	235
10.2.2	Exposed shores	236
10.2.3	Moderately exposed shores	237
10.2.4	Conclusion: the causes of instability	238
10.3	Disturbance and succession: mosaics on the shore	238
10.3.1	Disturbance on boulder shores	239
10.3.2	Disturbance on exposed rocky shores	242
10.3.3	The mosaic-cycle concept	242
10.4	Community structure: the influence of competition and facilitation	243
10.4.1	Interspecific competition	243
10.4.2	Intraspecific competition	245
10.4.3	Facilitation	245
10.4.4	Aggression	247
10.4.5	Conclusion: how important is competition?	247
10.5	The influence of recruitment: 'supply-side ecology'	248
10.5.1	Planktonic stages	248
10.5.2	Settlement and recruitment on the shore	250
10.6	Community structure: the influence of grazing	251
10.7	Community structure: the influence of parasites and predators	252
10.7.1	Do parasites affect the community?	253
10.7.2	Predation as a dominant force	253
10.7.3	When is predation not the dominant force?	255
10.8	Integrating biological and physical factors: environmental stress models	256
10.9	How important are individual species? Foundation species, dominant grazers, and keystone species	258
10.9.1	Foundation species	258

10.9.2	Dominant grazers	259
10.9.3	Keystone species: the importance of predators	260
10.9.4	The importance of multi-species interactions	262
10.10	'Top-down' and 'bottom-up' factors	265
10.11	Expanding scales: putting rocky shores into context	267
10.11.1	Interactions with subtidal and terrestrial ecosystems	267
10.11.2	From small scales to meso-scales and large scales	268
11	Human influences on rocky shores	270
11.1	Pollution and its effects	270
11.1.1	Acute accidental pollutant effects	270
11.1.2	Chronic pollution	272
11.1.3	Detection and monitoring	273
11.1.4	Eutrophication	275
11.1.5	Responses to pollution	276
11.2	Other human effects on community structure	278
11.2.1	The influence of invading or 'alien' species	278
11.2.2	Physical disturbance and trampling on the shore	282
11.2.3	Fisheries exploitation and by-catch	283
11.3	Community effects of climate change	285
11.3.1	Effects of El Niño	285
11.3.2	Effects of global warming	287
11.4	Conservation	288
11.4.1	Approaches to marine conservation	289
11.4.2	Marine protected areas	290
11.4.3	Marine protected areas—are they effective?	294
12	Methods and experimental approaches	297
12.1	Shore topography and the problems of physical surveys	297
12.1.1	Measuring the vertical tidal gradient	297
12.1.2	Measuring the horizontal wave-exposure gradient	300
12.2	Making quantitative observations: the search for pattern	302
12.2.1	Measuring abundance—qualitative methods	302
12.2.2	Measuring abundance—quantitative methods	303
12.2.3	Replicates and pseudoreplicates	306
12.3	Experimental designs: the search for processes	308
	Appendix: Name Changes of Ecologically Important Taxa	315
	Further reading	317
