1 An introduction to climate change	1
1.1 Weather or climate	2
1.2 The greenhouse effect	3
1.3 The carbon cycle	10
1.4 Natural changes in the carbon cycle	20
1.5 Pacemaker of the glacial–interglacial cycles	22
1.6 Non-greenhouse influences on climate	28
1.7 The water cycle, climate change and biology	31
1.8 From theory to reality	33
1.9 References	35
2 Principal indicators of past climates	37
2.1 Terrestrial biotic climatic proxies	39
2.1.1 Tree-ring analysis (dendrochronology)	39
2.1.2 Isotopic dendrochronology	43
2.1.3 Leaf shape (morphology)	45
2.1.4 Leaf physiology	46
2.1.5 Pollen and spore analysis	47
2.1.6 Species as climate proxies	50
2.2 Marine biotic climatic proxies	53
2.2.1 ^{18}O isotope analysis of forams and corals	53
2.2.2 Alkenone analysis	58
2.3 Non-biotic indicators	59
2.3.1 Isotopic analysis of water	59
2.3.2 Boreholes	61
2.3.3 Carbon dioxide and methane records as palaeoclimatic forcing agents	61
2.3.4 Dust as an indicator of dry–wet hemispheric climates	63
2.4 Other indicators	63

2.5	Interpreting indicators	64
2.6	Conclusions	64
2.7	References	65
3	Past climate change	67
3.1	Early biology and climate of the Hadean and Archean eons (4.6–2.5 billion years ago, bya)	67
3.1.1	The pre-biotic Earth (4.6–3.8 bya)	67
3.1.2	The early biotic Earth (3.8–2.3 bya)	68
3.2	Major bio-climatic events of the Proterozoic eon (2.5–0.542 bya)	71
3.2.1	Earth in the anaerobic–aerobic transition (2.6–1.7 bya)	71
3.2.2	The aerobic Earth (from 1.7 bya)	74
3.3	Major bio-climatic events of the pre-Quaternary Phanerozoic (540–2 mya)	77
3.3.1	Late-Ordovician extinction (455–435 mya)	77
3.3.2	Late-Devonian extinction (365–363.5 mya)	78
3.3.3	Vascular plants and the atmospheric depletion of carbon dioxide (350–275 mya)	79
3.3.4	Permo–Carboniferous glaciation (330–250 mya)	81
3.3.5	End-Permian extinction (251 mya)	83
3.3.6	End-Triassic extinction (205 mya)	85
3.3.7	Toarcian (early (late lower) Jurassic) extinction (183 mya)	86
3.3.8	Cretaceous–Tertiary extinction (65.5 mya)	87
3.3.9	Eocene climatic maximum (55–54.8 mya)	90
3.3.10	Eocene–Oligocene extinction (approximately 35 mya; or 33.9 mya?)	101
3.3.11	Late Miocene expansion of C ₄ grasses (14–9 mya)	103
3.4	Summary	108
3.5	References	109
4	The Oligocene to the Quaternary: climate and biology	113
4.1	The Oligocene (33.9–23.03 mya)	113
4.2	The end Miocene (9–5.3 mya)	115
4.3	The Pliocene (5.3–1.8 mya)	116
4.4	The current ice age	120
4.5	The last glacial	126
4.5.1	Overview of temperature, carbon dioxide and timing	126
4.5.2	Ice and sea level	129
4.5.3	Temperature changes within the glacial	130

4.5.4	Biological and environmental impacts of the last glacial	141
4.6	Interglacials and the present climate	148
4.6.1	Previous interglacials	148
4.6.2	The Allerød, Bølling and Younger Dryas (14 600–11 600 years ago)	152
4.6.3	The Holocene (11 500 years ago – the Industrial Revolution)	159
4.6.4	Biological response to the last glacial, LGM and Holocene transition	168
4.7	Summary	178
4.8	References	179
5	Present climate and biological change	184
5.1	Recent climate change	184
5.1.1	The latter half of the Little Ice Age	184
5.1.2	Twentieth-century climate	188
5.1.3	Twenty-first-century climate	189
5.1.4	The Holocene interglacial beyond the twenty-first century	189
5.1.5	Holocene summary	191
5.2	Human change arising from the Holocene climate	193
5.2.1	Climatic impacts on early human civilisations	193
5.2.2	The Little Ice Age's human impact	194
5.2.3	Increasing twentieth-century human climatic insulation	200
5.3	Climate and business as usual in the twenty-first century	201
5.3.1	IPCC Business as Usual	201
5.3.2	Uncertainties and the IPCC's conclusions	213
5.4	Current human influences on the carbon cycle	222
5.4.1	Carbon dioxide	222
5.4.2	Methane	226
5.4.3	Halocarbons	227
5.4.4	Nitrous oxide	228
5.5	References	228
6	Current warming and likely future impacts	231
6.1	Current biological symptoms of warming	231
6.1.1	Current boreal dendrochronological response	231
6.1.2	Current tropical-rainforest response	233
6.1.3	Some biological dimensions of the climatic-change fingerprint	235
6.1.4	Phenology	238

6.1.5	Biological communities and species shift	240
6.2	Case study: climate and natural systems in the USA	253
6.3	Case study: climate and natural systems in the UK	264
6.4	Biological response to greenhouse trends beyond the twenty-first century	275
6.5	Possible surprise responses to greenhouse trends in the twenty-first century and beyond	276
6.5.1	Extreme weather events	276
6.5.2	Greenhouse gases	279
6.5.3	Sea-level rise	280
6.5.4	Methane hydrates (methane clathrates)	289
6.5.5	Volcanoes	293
6.5.6	Oceanic and atmospheric circulation	296
6.5.7	Ocean acidity	301
6.5.8	The probability of surprises	304
6.6	References	305
7	The human ecology of climate change	310
7.1	Population (past, present and future) and its environmental impact	310
7.1.1	Population and environmental impact	310
7.1.2	Past and present population	319
7.1.3	Future population	322
7.1.4	Food	325
7.1.5	Impact on other species	327
7.2	Energy supply	330
7.2.1	Energy supply – the historical context	331
7.2.2	Future energy supply	337
7.3	Human health and climate change	343
7.3.1	Health and weather extremes	345
7.3.2	Climate change and disease	353
7.3.3	Flooding and health	361
7.3.4	Droughts	368
7.4	Climate change and food security	368
7.4.1	Past and present food security	368
7.4.2	Future food security and climate change	371
7.5	The biology of reducing anthropogenic climate change	377
7.5.1	Terrestrial photosynthesis and soil carbon	378
7.5.2	Manipulating marine photosynthesis	383
7.5.3	Biofuels	384
7.6	Summary and conclusions	387
