List of figures xv

1 Introduction 1
1.1 Aims and general concept of the thesis 1
1.2 Thesis structure 4

I SIMULATION METHODS AND OTHER APPROACHES TO STOCHASTIC PROBLEMS 9

2 Probabilistic assessment of computationally intensive problems 11
2.1 Reliability theory 11
2.1.1 Fundamental concept of structural reliability 12
2.1.2 Response and limit state functions 13
2.1.3 Reliability index 13
2.1.4 Failure probability 14
2.2 Stochastic analysis software 16
2.3 LHS: the small-sample stochastic technique 17
2.4 LHS: sensitivity analysis (nonparametric rank-order) 18
2.5 LHS: reliability estimation based on curve fitting 20

3 Correlation control in Monte Carlo simulation via combinatorial optimization 23
3.1 Introduction 24
3.2 Review of small sample Monte Carlo and LHS 25
3.2.1 Univariate sampling 26
3.2.2 Correlation of samples 27
3.2.3 LHS: Sampling and statistical correlation 29
3.3 Minimization/optimization by Simulated Annealing method 30
3.4 Application of Annealing to correlation control in Monte Carlo sampling 31
3.4.1 Cooling schedule 36
3.5 Numerical examples 37
3.5.1 Correlated properties of concrete 37
3.5.2 Non-positive definite prescribed correlation matrix? 40

3.6 Summary . . . 40

4 Performance of correlation control and relevance to multivariate modeling 43
4.1 Introduction . . . 43
4.2 Performance studies . . . 44
4.2.1 Performance tests with uncorrelated variables . . . 45
4.2.2 Performance tests with correlated variables . . . 47
4.2.3 Discussion of results . . . 47
4.3 Uniqueness of joint probability density function . . . 49
4.4 Speed issues . . . 51
4.5 Conclusions . . . 53

5 Simulation of cross correlated random fields by series expansion methods 55
5.1 Introduction . . . 55
5.2 Series expansion methods for the simulation of a random field . . . 57
5.2.1 Karhunen-Loève expansion (KLE) . . . 59
5.2.2 Expansion optimal linear estimation (EOLE) . . . 60
5.3 Cross correlated Gaussian random fields . . . 61
5.3.1 Method for simulation of cross-correlated random fields . . . 62
5.3.2 Simulation of random variables . . . 67
5.3.3 Summary of the method . . . 67
5.4 Transformation to non-Gaussian random fields . . . 69
5.5 A numerical example . . . 73
5.5.1 Transformation to a non-Gaussian random field . . . 75
5.6 Error assessment of random field simulation . . . 78
5.7 Application in modeling of wind speed history . . . 82
5.8 Application in modeling of material properties . . . 82
5.9 Conclusions . . . 84

6 Error assessment of random fields simulated via Stratified sampling 87
6.1 Introduction . . . 87
6.2 Orthogonal transformation of covariance matrix . . . 88
6.3 Latin Hypercube Sampling utilization . . . 90
6.4 Error assessment of random field simulation . . . 90
6.4.1 Reduction of spurious correlation . . . 91
6.4.2 Classification of sampling schemes . . . 93
6.5 Conclusions . . . 96

7 Hierarchical Subset Latin Hypercube Sampling 99
7.1 Introduction . . . 99
7.2 Correlation control for adding and merging simulations . . . 100
7.3 Hierarchical Subset LHS based on hierarchy of levels . . . 102
7.3.1 Univariate sampling . . . 103
7.3.2 Multivariate sampling . . . 106
7.4 Numerical examples: functions of random vectors . . . 106
7.4.1 Independent variables . . . 107
7.4.2 Statistically dependent variables . . . 107
7.5 Results and discussion . . . 108
7.6 Conclusions . . . 108

II STOCHASTIC MODELING OF MULTI-FILAMENT YARNS FOR TEXTILE REINFORCED CONCRETE 115

8 Micromechanical model and random properties within the yarn cross section 117

8.1 Introduction . . . 117
8.2 Effects included in the tensile test . . . 120
8.3 Computational model . . . 123
8.3.1 Kinematic model and constitutive law . . . 123
8.3.2 Numerical evaluation of the load-strain diagram for finite n . . . 125
8.3.3 Continuous asymptotic model for infinite n . . . 126
8.4 Parametric studies . . . 127
8.4.1 Scatter of filament lengths . . . 127
8.4.2 Scatter of filament diameters . . . 129
8.4.3 Scatter of filament activation strain (slack) . . . 131
8.4.4 Interaction of scatter of filament lengths and delayed activation . . . 134
8.4.5 Effect of yarn twist . . . 135
8.5 Correspondence between the delayed activation and waviness . . . 137
8.6 Identification of the parameter distributions . . . 138
8.7 Summary . . . 140

9 Random properties over the length and size effect 143

9.1 Introduction . . . 143
9.2 Random strength along the filament . . . 145
9.2.1 Spatial strength randomization using IID . . . 145
9.2.2 Spatial strength randomization using stationary random process . . . 147
9.3 Random strength along filaments within the bundle . . . 149
9.3.1 Comparison with Daniels's numerical recursion . . . 150
9.3.2 Comparison with available asymptotic results . . . 150
9.3.3 Size effect of bundles for variable number of filaments n . . . 153
9.4 Interaction of random stiffness and strength along the bundle . . . 155
9.4.1 Random E-modulus and strength along a single filament . . . 155
9.4.2 One-parameter randomization of the constitutive law along the bundle . . . 157
9.4.3 Two-parameter randomization of the constitutive law along the bundle . . . 159
9.5 Application to the experiment . . . 161
9.5.1 Testing of single filament . . . 161
9.5.2 Tensile test on a bundle . . . 162
9.5.3 Systematic identification of the distribution parameters . . . 164
9.6 Summary . . . 166

10 Evaluation of mean performance of cracks bridged by multi-filament yarns 169

10.1 Introduction . . . 169
10.2 Approaches to modeling crack bridge behavior . . . 170
10.3 Objectivity of the material parameters . . . 171
10.4 Effect of finite bond strength . . . 172
10.5 Effect of scatter in bond strength . . . 174
10.6 Effect of correlation . . . 174
10.7 Application to the experiment . . . 176
10.8 Summary . . . 178

11 TRC-Specimens Modeled as a Chain of Cracks Bridged by Bundles **181**
11.1 Introduction 181
11.2 General determination of TRC strength statistics 182
11.3 Examples for selected crack bridge models in a chain 183
11.3.1 Example 1: Bundle model with perfect clamping 183
11.3.2 Example 2: Bundle model with debonding 185
11.4 Summary 186

12 A multivariate study on tensile behavior of twisted yarns **187**
12.1 Introduction 187
12.2 Test setup 189
12.3 Experiment design 190
12.4 Results and discussion 192
12.4.1 Design I 192
12.4.2 Design I+II 194
12.4.3 Interpretation of the response 194
12.5 Summary 197

III STOCHASTIC MODELING OF QUASIBRITTLE MATERIALS **201**

13 Size effect on modulus of rupture of concrete structures: state of the art **203**
13.1 Introduction 203
13.2 Nonlinear fracture mechanics and deterministic size effect 205
13.3 Stochastic nonlinear fracture mechanics and complex size effect 205
13.3.1 Statistical size effect and Nonlocal Weibull theory 206
13.4 Plinth of Schoharie Creek Bridge 208

14 Connections of fiber bundles models and size effect of concrete structures **209**
14.1 General size effect theory 209
14.1.1 Energetic size effect 210
14.1.2 Probabilistic size effect 210
14.2 Asymtotics of size effect 210
14.2.1 Small-size asymptotes 210
14.2.2 Large-size asymptotes 212
14.3 Transition between small and large size asymptotes 213
14.3.1 Chain of bundles model 213
14.3.2 Nonlinear stochastic finite element method 214
14.4 Concluding remarks 214

15 Computational modeling of statistical size effect: extreme value approach **217**
15.1 Introduction 217
15.2 Weakest link concept and theory of extreme values 219
15.2.1 Limiting forms of distribution of minimum 222
15.3 Implications for finite element method 223
15.4 Numerical example: size effect of span in four-point bending tests 224
15.4.1 Experiment and attempt at deterministic simulation 224
15.4.2 Statistical size effect 225
15.5 Conclusions 227
15.6 Further discussion 228

16 Interplay of size effects in concrete specimens under tension **231**
16.1 Introduction . . . 231
16.2 Experiments . . . 234
16.3 The deterministic model . . . 234
16.4 Weak boundaries . . . 236
16.5 The stochastic model . . . 237
16.5.1 The Weibull integral . . . 243
16.5.2 Comments on local and non-local Weibull theories . . . 245
16.6 Analysis of the results . . . 246
16.7 Summary . . . 248

17 Asymptotic Prediction of Energetic-Statistical Size Effect: New size effect law **249**
17.1 Introduction . . . 250
17.2 Nonlocal and Classical Weibull Statistical Theories . . . 251
17.3 Energetic Size Effect Formula and Its Statistical Generalization . . . 252
17.3.1 Energetic-Statistical Size Effect Formula . . . 254
17.4 Analytical prediction of the energetic-probabilistic size effect . . . 257
17.5 Numerical Example Reinterpreting Malpasset Dam Catastrophe . . . 260
17.5.1 Deterministic Nonlinear Fracture Analysis . . . 260
17.5.2 Size effect obtained from formulas calibrated by deterministic computations 263
17.5.3 Verification by Stochastic Element Simulations . . . 263
17.6 "Random Block Method" for Efficient Stochastic Simulations . . . 264
17.6.1 Comments on Autocorrelation vs. Nonlocality . . . 266
17.7 Summary . . . 266

IV COMPUTATIONAL MECHANICS TECHNIQUES FOR STRUCTURES WITH RANDOM PROPERTIES **269**

18 Adaptive probabilistic modeling of processes in quasi-brittle failure **271**
18.1 Introduction . . . 271
18.2 Computational model . . . 273
18.2.1 Basic equations of the algorithm . . . 274
18.3 Numerical example . . . 279
18.4 Discussion . . . 280
18.5 Summary . . . 281

19 Overall conclusions and recommendations for future research **283**

A Software FReET **287**
A.1 Introduction . . . 287
A.2 Main program tree . . . 288
A.3 Stochastic model . . . 288
A.3.1 Random variables . . . 288
A.3.2 Statistical correlation . . . 291
A.4 Response or limit state function definition . . . 292
A.4.1 FReET M-version . . . 292
A.4.2 FReET A-version . . . 293
A.5 Sampling . . . 293

A.5.1 General data . . . 293
A.5.2 Check of the samples . . . 293
A.5.3 Model analysis . . . 294
A.6 Simulation results assessment . . . 295
A.6.1 Histograms . . . 295
A.6.2 Limit state function definition . . . 296
A.6.3 Sensitivity analysis . . . 297
A.6.4 Reliability analysis . . . 297
A.7 Software ATENA . . . 299
A.8 Summary . . . 301
A.9 Available probability distributions in FReET . . . 302

B Stochastic analyses: problem revision and software design 309
B.1 Introduction . . . 309
B.2 Simple design of small sample analysis program . . . 310
B.3 Revision of a complex stochastic analysis . . . 311
B.3.1 Inputs . . . 311
B.3.2 Outputs . . . 311
B.4 Identification of the main ingredients of the analysis . . . 312
B.5 Main software components and their communication . . . 314
B.6 What the user sees on the screen . . . 318
B.7 Data storage . . . 320
B.8 Summary . . . 321
