
CONTENTS

1. GENERAL DEFINITION OF HEALTH AND DISEASE	7
1.1. Normative and neutral conceptions of health and disease	8
1.1.1. Problems of the neutral conception	9
1.1.2. Problems of the normative conception	10
1.2. Both conceptions are independent and complementary	12
1.3. Scientific theory of disease is still missing	14
2. DISTINGUISHING BETWEEN HEALTH AND DISEASE	15
2.1. General procedure of disease taxonomy and diagnostics	15
2.2. Interindividual variability, frequency distributions of characters	16
2.3. Mathematical models of interindividual variability	18
2.3.1. Binomial and normal distribution in biology	18
2.3.2. Non-additivity of biological factors	21
2.3.3. Further peculiarities of biological factors	22
3. ALTERNATIVE MODEL OF HEALTH AND DISEASE	27
3.1. Conception of normality and its role in diagnostics	29
3.2. Normal range and the reference interval	31
3.3. Selective testing versus screening batteries of tests	35
4. PATHOLOGY ARISING INSIDE THE HOMOGENEOUS POPULATION. GRADED MODEL OF HEALTH AND DISEASE..	37
5. INTERACTION OF FACTORS, EVOLUTIONARY CONSTRAINTS, MULTIVARIATE NORM	42
5.1. Several characters in system interaction	42
5.2. Healthy (eufunctional) extremes, individual norm, evolutionary constraints and a "functional design" of an individual	44
5.3. Multivariate statistical methods for the determination of reference intervals	46
6. BIBLIOGRAPHY	48
SOUHRN	50
