

CONTENTS

- 1 Introduction 7
- 2 Brief outline of circadian rhythmicity 9
 - 2.1 Basic terms in the theory of circadian rhythms 9
 - 2.2 Entrainment of circadian rhythms 10
 - 2.3 Location of circadian pacemakers and photoreception 13
 - 2.4 Hierarchy of the circadian system 14
 - 2.5 Significance of circadian rhythmicity 15
- 3 Short introductory line to the pineal gland 17
 - 3.1 Role of the pineal gland 17
 - 3.2 Formation of melatonin 19
 - 3.3 Circadian control of melatonin production 21
 - 3.4 Neural regulation of melatonin synthesis 24
 - 3.5 Sites of action of melatonin 26
- 4 Suppressive effect of light on the circadian rhythm in melatonin production 28
 - 4.1 Effect of an abrupt exposure to light at night on melatonin production 28
 - 4.2 Mechanism of changes of N-acetyltransferase (NAT) activity during an abrupt exposure to light at night 29
 - 4.3 Influence of different intensity and wavelength of light on the decline in nocturnal melatonin production 33
 - 4.4 Effect of the duration of exposure to light on nocturnal melatonin production 35
 - 4.5 Suppressive versus entraining effect of light on the circadian rhythm in melatonin production 37
- 5 Entrainment effect of light on the circadian NAT activity rhythm 39
 - 5.1 Evaluation of phase-shifts of the NAT rhythm 39
 - 5.2 Phase-shifts of the NAT rhythm during the night when 1 min light pulses were applied 39
 - 5.3 Phase-shifts of the NAT rhythm after one and four days following presentation of 1 min light pulses 42
 - 5.4 One-oscillator pacemaking system controlling the NAT rhythm versus two-oscillator pacemaking system 46
 - 5.5 Discussion on the model of two-oscillator pacemaking system controlling the NAT rhythm 47
 - 5.6 Explanation of transient cycles in the NAT rhythm adjustment after light pulses by a two-oscillator structure of the pacemaker 48
 - 5.7 Involvement of the morning oscillator in the control of NAT inducibility by darkness after light pulses at night 48
 - 5.8 Meaning of the phase-relationship between the evening and the morning oscillator 51

- 6 Photoperiodic effect of light on the circadian rhythm in melatonin production 53
 - 6.1 Pineal rhythms under different photoperiods 53
 - 6.2 Time course of adjustment of the NAT rhythm to change of photoperiod 59
 - 6.3 Locking of the NAT rhythm to the morning onset of light under different photoperiods 62
 - 6.4 Entrainment of the NAT rhythm under different photoperiods 62
 - 6.5 Entraining versus suppressive effect of light on the NAT rhythm under different photoperiods 66
- 7 Role of the rhythm in melatonin production in photoperiodic responses 71
 - 7.1 Indirect evidences for the involvement of the duration of nocturnal melatonin production in photoperiodic responses 71
 - 7.2 Direct evidences for the decisive role of the duration of high nocturnal melatonin levels in photoperiodic responses 75
 - 7.3 Effect of previous light conditions on photoperiodic responses and on the melatonin rhythm 77
 - 7.4 Correlation between the time-course of the melatonin rhythm adjustment to a change of photoperiod and the rate of photoperiodic responses 77
 - 7.5 Photoperiodic responses and adjustment of pineal rhythms to change of photoperiod in the course of the whole life 84
- 8 Summary 88
- 9 Резюме 93
- 10 Conclusion 95
- 11 References 96
