| <b>Programme</b>                                                                                                        | <b>xi</b> |
| <b>Abstracts</b>                                                                                                        | <b>1</b>  |
| <b>Keynote lectures</b>                                                                                                 | <b>1</b>  |
| <i>P. J. Cameron</i> : Association schemes, graph homomorphisms,<br>and synchronization                                 | 1         |
| <i>E. van Dam</i> : Applications of semidefinite programming, sym-<br>metry, and algebra to graph partitioning problems | 1         |
| <i>T. Ito</i> : Towards the classification of $(P$ and $Q)$ -polynomial<br>schemes                                      | 2         |
| <i>M. Muzychuk</i> : Isomorphism problem for Cayley objects                                                             | 3         |
| <i>D. Pasechnik</i> : Abstract regular polytopes and $Y$ -presentations<br>for sporadic groups                          | 3         |
| <i>I. Ponomarenko</i> : Schurian vs non-schurian coherent configurations                                                | 5         |
| <i>S. Shpectorov</i> : From transposition groups to algebras                                                            | 6         |
| <b>Memorial sessions</b>                                                                                                | <b>7</b>  |
| <i>R. Bailey</i> : How group theory and statistics met in association<br>schemes                                        | 7         |
| <i>E. Bannai</i> : History of the study of association schemes, a<br>personal view                                      | 8         |
| <i>R. Curtis</i> : Graphs and groups                                                                                    | 9         |
| <i>I. Faradjev</i> : "Symmetry vs Regularity". How it started and what<br>it led to                                     | 10        |
| <i>M. Fürer</i> : On the power of $WL[k]$                                                                               | 10        |
| <i>W. Haemers</i> : Jaap Seidel's network                                                                               | 11        |

|                                                                                                                 |    |
|-----------------------------------------------------------------------------------------------------------------|----|
| <i>Andrei Ivanov</i> : Remembering Volodya Zaichenko                                                            | 11 |
| <i>R. Jajcay</i> : Dale Mesner and his contributions to algebraic combinatorics                                 | 11 |
| <i>K.W. Johnson</i> : Schur, Wielandt, Tamaschke: The development of $S$ -rings into a tool for group theorists | 12 |
| <i>R. Pöschel</i> : Issai Schur, Helmut Wielandt and schurian Schur-rings                                       | 12 |
| <i>A. Sankey</i> : Variations on some themes in the work of Donald G. Higman                                    | 13 |
| <i>L. Weisfeiler</i> : Boris Weisfeiler (1941-1985?). Life of mathematician, adventurer, and uncle              | 14 |

## **Invited lectures** **15**

|                                                                                                                             |    |
|-----------------------------------------------------------------------------------------------------------------------------|----|
| <i>A. Gavrilyuk</i> : The Graham Higman method and beyond                                                                   | 15 |
| <i>B. Kivva</i> : Minimal degree of the automorphism group of primitive coherent configurations                             | 16 |
| <i>E. Konstantinova</i> : Integral Cayley graphs on $\text{Sym}_n$ and $A_n$                                                | 16 |
| <i>A. Vasilyev</i> : Coherent configurations with nonsolvable automorphism group                                            | 17 |
| <i>O. Verbitsky</i> : The Weisfeiler-Leman dimension and the speed of color stabilization — logical and algorithmic aspects | 17 |
| <i>J. Wilmes</i> : Primitive coherent configurations with very many automorphisms                                           | 19 |

## **Contributed talks** **21**

|                                                                                                                      |    |
|----------------------------------------------------------------------------------------------------------------------|----|
| <i>A. Abiad</i> : Graph switching, 2-ranks, and graphical Hadamard matrices                                          | 21 |
| <i>N. Abrosimov</i> : Geometric structures on the complement of a knotted $\theta$ -graph embedded in $\mathbb{S}^3$ | 21 |
| <i>D. Crnković</i> : Strongly regular graphs constructed from groups                                                 | 23 |
| <i>H. Derksen</i> : The Graph Isomorphism Problem and the Module Isomorphism Problem                                 | 23 |
| <i>S. Goryainov</i> : $PI$ -eigenfunctions of the star graphs                                                        | 24 |
| <i>G. Greaves</i> : Edge-regular graphs and regular cliques                                                          | 24 |
| <i>M. Hirasaka</i> : On $p$ -valenced association schemes whose thin residue has valency $p^2$                       | 25 |
| <i>S. Humphries</i> : Commutative Schur rings of maximal dimension                                                   | 25 |

|                                                                                                                      |    |
|----------------------------------------------------------------------------------------------------------------------|----|
| <i>V. Kabanov</i> : Deza graphs with parameters $(n, k, k - 1, a)$                                                   | 26 |
| <i>J. Lauri</i> : Two-fold orbitals                                                                                  | 26 |
| <i>M. Mačaj</i> : On packings of disjoint copies of the Hoffman-Singleton graph into $K_{50}$                        | 27 |
| <i>N. Maslova</i> : On pronormal subgroups in finite groups                                                          | 28 |
| <i>A. Mednykh</i> : On asymptotics and arithmetical properties of complexity for circulant graphs                    | 31 |
| <i>Ch. Pech</i> : Highly regular graphs. Part one: Introduction and examples                                         | 31 |
| <i>M. Pech</i> : Highly regular graphs. Part two: On a family of strongly regular graphs by Brouwer, Ivanov and Klin | 33 |
| <i>S. Reichard</i> : Implementation of stabilization algorithms for configurations                                   | 34 |
| <i>D. Roberson</i> : Coherent configurations from quantum permutation groups                                         | 35 |
| <i>G. Ryabov</i> : Separability and schurity of Cayley schemes over Abelian groups                                   | 36 |
| <i>P. Schweitzer</i> : The Weisfeiler-Leman dimension of graphs and isomorphism testing                              | 37 |
| <i>S. Skresanov</i> : Finding a maximal subgroup of minimal index in polynomial time                                 | 39 |
| <i>G. Somlai</i> : Discrete version of Fuglede's conjecture and Pompeiu problem                                      | 40 |
| <i>M. Whybrow</i> : Constructing Majorana representations                                                            | 41 |

## **Short presentations** 43

|                                                                                                           |    |
