

# Contents

Introduction .....	7
I. Material and Methods .....	9
II. Evolution of parasitic trematodes from free-living protrematodes .....	12
III. Primitive life-cycle of trematodes (primary diheteroxenia) .....	25
1. Life-cycle without adolescaria .....	25
2. Life-cycle with adolescaria (models - <i>Notocotylus attenuatus</i> , <i>Philophthalmus</i> sp.) .....	25
IV. Three-host life-cycle of trematodes bound to water environment .....	36
1. Origin of tri- and tetraheteroxenia .....	36
2. Significance of the second intermediate host .....	39
3. Adaptation of cercaria to penetration into the second intermediate host, modification of cyst wall and differentiation of metacercaria (models - <i>Moliniella anceps</i> , <i>Echinoparyphium</i> <i>aconiatum</i> , <i>Plagiorchis laricola</i> ) .....	40
V. Life-cycles of trematodes bound to terrestrial environment .....	53
1. Phylogenesis of terrestrial snails and their adaptation to the existence on land .....	53
2. Adaptation of trematode larvae to parasitism in terrestrial snails .....	56
VI. Three-host life-cycle of trematodes bound to terrestrial environment (models - <i>Dicrocoelium</i> <i>lanceatum</i> , <i>Eurytrema pancreaticum</i> , <i>Corrigia</i> <i>corrigia</i> , <i>Brachylaimus aequans</i> ) .....	60
VII. Secondary two-host life-cycles of trematodes bound to terrestrial environment (models - <i>Hasstilesia ovis</i> , <i>Leucochloridium paradoxum</i> , <i>L. perturbatum</i> ) .....	79
VIII. Conclusion .....	88
IX. References .....	91
