Contents

1 Between the Transistor and the High-Level Language **1**

1.1 Prior Perceptions 1
1.2 A Spectrum of Digital Languages 3
1.3 Control Flow 6
1.4 Terms and Roles 8
1.5 Some Digital History 9

2 Boolean Algebra and Digital Logic **11**

2.1 Computer Logic Circuits 11
2.2 Application of Logic Circuits 15
2.3 Evaluation of Boolean Functions 19
2.4 Boolean Algebra 21
2.5 Simplification of Boolean Functions 26
2.6 Boolean Algebra as an Algebra of Subsets 28
2.7 On the History of the Algebra of Logic 31
Problems 31
References 33

3 0, 1: Binary Numbers or Logical Values? **35**

3.1 The Binary Number System 35
3.2 Conversion between Bases 37

3.3 Binary Coding of Decimal Digits 40
3.4 Historical Note 43
Problems 44
References 44

4 Simplification of Boolean Functions 45

4.1 Standard Forms of Boolean Functions 45
4.2 Karnaugh Map Representation of Boolean Functions 52
4.3 Simplification of Functions on the Karnaugh Map 60
4.4 Map Minimization of Product-of-Sums Expressions 66
4.5 Incompletely Specified Functions 68
Problems 71
References 73

5 Standard Digital Integrated Circuits 75

5.1 Introduction 75
5.2 Small-Scale Integrated Circuits 79
5.3 Fan-out, Fan-in, and Noise Immunity 80
5.4 Switching Delay in Logic Circuits 85
5.5 Circuit Implementation with NAND and NOR Gates 87
5.6 Multilevel All-NAND Realizations 89
5.7 Reducing Package Counts in Multilevel Realizations 94
Problems 98
References 101

6 Computer Arithmetic and Codes 101

6.1 Introduction 103
6.2 Conversion between Number Bases 103
6.3 Coding of Information 106
6.4 Parity 111
6.5 Binary Arithmetic 113
6.6 Implementation of Binary and BCD Addition 117
6.7 Carry and Overflow 121
Problems 123
References 126

7 Combinational MSI Parts, ROMs, and PLAs 127

7.1 Perspective 127
7.2 Combinational MSI Parts 128
7.3 Read-Only Memory 137
7.4 Chip-Select, Buses, and Three-State Switches 144

7.5 Programmed Logic Arrays 147
7.6 Describing Multiplexers with a Graphic Vector Notation 153
7.7 Special Purpose MSI Parts 154
Problems 158
References 161

8 Sequential Circuits 163

8.1 Storage of Information 163
8.2 Clocking 166
8.3 Registers 171
8.4 Memory Element Input Logic 173
8.5 A First Design Example 174
8.6 The *J-K* Flip-Flop 177
8.7 Design of Counters 181
8.8 MSI Registers and Counters 187
Problems 195
References 197

9 Synthesis of State Machines 199

9.1 A Language is Needed 199
9.2 Standard Symbols for the ASM Chart 200
9.3 Vending Machine Control 204
9.4 From ASM Charts to Transition Tables 208
9.5 Circuit Realization 212
9.6 The State Diagram, an Alternative Notation 216
9.7 Compatible States 221
Problems 223
References 227

10 Register Transfer Design 229

10.1 Generalized ASM Output 229
10.2 ASM Chart Representation of a Control Unit 231
10.3 Register Transfer Language (RTL) Notation 233
10.4 Construction of a Data Unit from an RTL Description 239
10.5 Timing of Connections and Transfers 242
10.6 Sequencing of Control 245
10.7 Combinational Logic and Conditional Transfers 248
10.8 Graphical and RTL Bus Notation 254
10.9 Timing Refinements in RTL Systems 256
10.10 An RTL Design Example 257
Problems 262
References 266

11 Small Computer Organization and Progamming **267**

11.1 Introduction 267
11.2 Central Processor and Memory Organization 268
11.3 CPU Organization and Instruction Formats 270
11.4 Fundamental Internal Sequence of a Single-Address Computer 272
11.5 Transfer-of-Control and Register-Only Instructions 279
11.6 Addition and Subtraction with Carry 286
11.7 Commands That Affect Only the Flags 290
11.8 Programming Procedures 292
Problems 296

12 Addressing and Assembly Language **301**

12.1 Microprocessor Addressing 301
12.2 Addressing Modes 302
12.3 Assembly Language Programming 311
12.4 More Programming 316
12.5 Data Conversion, Decimal Arithmetic, and Subroutines 320
Problems 330

13 Memory and Input/Output **333**

13.1 Memory Mapping 333
13.2 Timing of Memory Operation 338
13.3 Parallel Input/Output Interfacing 340
13.4 Interactive Input/Output 346
13.5 Programming Time Delays 355
13.6 Device Drivers 359
13.7 Substituting Input Scanning for Combinational Logic 366
13.8 Time-Sharing of Interface Ports 370
Problems 375
References 378

14 Serial Input/Output **379**

14.1 Serial to Parallel Conversion 379
14.2 A Serial Communications Interface Adapter TBSIA 388
14.3 A Subroutine for Serial I/O through a TBSIA 393
14.4 Interconnecting RS-232 Equipments 396
14.5 Computer Networks 400
Problems 403
References 406

15 Additional Programming Topics 407

15.1 Pointer Addressing and Stacks 407
15.2 Subroutines 411
15.3 Interrupts 426
15.4 Start-up and Reset 437
15.5 Tables and Other Data Structures 439
Problems 450
References 455

16 Microprocessor-Based Systems Design 457

16.1 Introduction 457
16.2 Vending Machine Operation 457
16.3 System Specifications 459
16.4 Control Unit Design 462
16.5 Planning the Program 465
16.6 Memory Map Layout 471
16.7 Coding the Program 475
Problems 479

17 The Clock-Mode Assumption Reexamined 481

17.1 Attention to Output Waveforms 481
17.2 Elimination of Hazards 484
17.3 Synchronizing Inputs to Clock-Mode Circuits 486
17.4 Clock Skew on Edge-Triggered Flip-Flops 491
17.5 Is That Clock Really Necessary? 493
17.6 Synthesis of Level-Mode Sequential Circuits from a Flow Table 498
17.7 Races in State Variable Transitions 504
17.8 Critical Race-Free State Assignments 511
17.9 More Constraints on Level-Mode Realizations 516
Problems 518
References 522

Appendix A Powers of Two 523
Appendix B Summary of TB6502 Instruction Set 524
Appendix C TB6502 Instruction Set: Opcodes, Bytes, Cycles 527
Appendix D Mapping the TB6502 into the 6502 530
