Preface	ix
Series Preface	xiii
1 Introduction	1
1.1 Introductory Remarks	1
1.2 Nonspatial Models for a Single Species	3
1.3 Nonspatial Models For Interacting Species.	8
1.3.1 Mass-Action and Lotka-Volterra Models	8
1.3.2 Beyond Mass-Action: The Functional Response	9
1.4 Spatial Models: A General Overview	12
1.5 Reaction-Diffusion Models	19
1.5.1 Deriving Diffusion Models	19
1.5.2 Diffusion Models Via Interacting Particle Systems: The Importance of Being Smooth	24
1.5.3 What Can Reaction-Diffusion Models Tell Us?	28
1.5.4 Edges, Boundary Conditions, and Environmental Heterogeneity	30
1.6 Mathematical Background	33
1.6.1 Dynamical Systems	33
1.6.2 Basic Concepts in Partial Differential Equations: An Example	45
1.6.3 Modern Approaches to Partial Differential Equations: Analogies with Linear Algebra and Matrix Theory	50
1.6.4 Elliptic Operators: Weak Solutions, State Spaces, and Mapping Properties	53
1.6.5 Reaction-Diffusion Models as Dynamical Systems.	72
1.6.6 Classical Regularity Theory for Parabolic Equations	76
1.6.7 Maximum Principles and Monotonicity	78
2 Linear Growth Models for a Single Species: Averaging Spatial Effects Via Eigenvalues	89
2.1 Eigenvalues, Persistence, and Scaling in Simple Models	89
2.1.1 An Application: Species-Area Relations	91
2.2 Variational Formulations of Eigenvalues: Accounting for Heterogeneity	92
2.3 Effects of Fragmentation and Advection/Taxis in Simple Linear Models	102
2.3.1 Fragmentation	102
2.3.2 Advection/Taxis	104
2.4 Graphical Analysis in One Space Dimension	107
2.4.1 The Best Location for a Favorable Habitat Patch	107
2.4.2 Effects of Buffer Zones and Boundary Behavior	112
2.5 Eigenvalues and Positivity	117

2.5.1	Advective Models	119
2.5.2	Time Periodicity	123
2.5.3	Additional Results on Eigenvalues and Positivity	125
2.6	Connections with Other Topics and Models	126
2.6.1	Eigenvalues, Solvability, and Multiplicity	126
2.6.2	Other Model Types: Discrete Space and Time	127
	Appendix	130
3	Density Dependent Single-Species Models	141
3.1	The Importance of Equilibria in Single Species Models	141
3.2	Equilibria and Stability: Sub- and Supersolutions	144
3.2.1	Persistence and Extinction	144
3.2.2	Minimal Patch Sizes	146
3.2.3	Uniqueness of Equilibria	148
3.3	Equilibria and Scaling: One Space Dimension	151
3.3.1	Minimum Patch Size Revisited	151
3.4	Continuation and Bifurcation of Equilibria	159
3.4.1	Continuation	159
3.4.2	Bifurcation Results	164
3.4.3	Discussion and Conclusions	173
3.5	Applications and Properties of Single Species Models	175
3.5.1	How Predator Incursions Affect Critical Patch Size	175
3.5.2	Diffusion and Allee Effects	178
3.5.3	Properties of Equilibria	182
3.6	More General Single Species Models	185
	Appendix	193
4	Permanence	199
4.1	Introduction	199
4.1.1	Ecological Overview	199
4.1.2	ODE Models as Examples	202
4.1.3	A Little Historical Perspective	211
4.2	Definition of Permanence	213
4.2.1	Ecological Permanence	214
4.2.2	Abstract Permanence	216
4.3	Techniques for Establishing Permanence	217
4.3.1	Average Lyapunov Function Approach	218
4.3.2	Acyclicity Approach	219
4.4	Invisability Implies Coexistence	220
4.4.1	Acyclicity and an ODE Competition Model	221
4.4.2	A Reaction-Diffusion Analogue	224
4.4.3	Connection to Eigenvalues	228
4.5	Permanence in Reaction-Diffusion Models for Predation	231
4.6	Ecological Permanence and Equilibria	239
4.6.1	Abstract Permanence Implies Ecological Permanence	239
4.6.2	Permanence Implies the Existence of a Componentwise Positive Equilibrium	240
	Appendix	241

5	Beyond Permanence: More Persistence Theory	245
5.1	Introduction	245
5.2	Compressivity	246
5.3	Practical Persistence	252
5.4	Bounding Transient Orbits	261
5.5	Persistence in Nonautonomous Systems	265
5.6	Conditional Persistence	278
5.7	Extinction Results	284
	Appendix	290
6	Spatial Heterogeneity in Reaction-Diffusion Models	295
6.1	Introduction	295
6.2	Spatial Heterogeneity within the Habitat Patch	305
6.2.1	How Spatial Segregation May Facilitate Coexistence	308
6.2.2	Some Disparities Between Local and Global Competition	312
6.2.3	Coexistence Mediated by the Shape of the Habitat Patch	316
6.3	Edge Mediated Effects	318
6.3.1	A Note About Eigenvalues	319
6.3.2	Competitive Reversals Inside Ecological Reserves Via External Habitat Degradation: Effects of Boundary Conditions	321
6.3.3	Cross-Edge Subsidies and the Balance of Competition in Nature Preserves	329
6.3.4	Competition Mediated by Pathogen Transmission	335
6.4	Estimates and Consequences	340
	Appendix	344
7	Nonmonotone Systems	351
7.1	Introduction	351
7.2	Predator Mediated Coexistence	356
7.3	Three Species Competition	364
7.3.1	How Two Dominant Competitors May Mediate the Persistence of an Inferior Competitor	364
7.3.2	The May-Leonard Example Revisited	373
7.4	Three Trophic Level Models	378
	Appendix	386
	References	395
	Index	409
