Preface to the Second Edition	vii
Preface to the First Edition	ix
1 Introduction: Forest Fires, Fractal Oil Fields, and Diffusion	1
1.1 What is percolation?	1
1.2 Forest fires	5
1.3 Oil fields and fractals	8
1.4 Diffusion in disordered media	10
1.5 Coming attractions	13
Further reading	13
2 Cluster Numbers	15
2.1 The truth about percolation	15
2.2 Exact solution in one dimension	19
2.3 Small clusters and animals in d dimensions	23
2.4 Exact solution for the Bethe lattice	26
2.5 Towards a scaling solution for cluster numbers	34
2.6 Scaling assumptions for cluster numbers	40
2.7 Numerical tests	43
2.8 Cluster numbers away from p_c	53
Further reading	56
3 Cluster Structure	57
3.1 Is the cluster perimeter a real perimeter?	57
3.2 Cluster radius and fractal dimension	59
3.3 Another view on scaling	64
3.4 The infinite cluster at the threshold	65
Further reading	69
4 Finite-size Scaling and the Renormalization Group	70
4.1 Finite-size scaling	70
4.2 Small cell renormalization	75
4.3 Scaling revisited	81
4.4 Large cell and Monte Carlo renormalization	83
4.5 Connection to geometry	86
Further reading	87

5	Conductivity and Related Properties	89
5.1	Conductivity of random resistor networks	89
5.2	Internal structure of the infinite cluster	94
5.3	Multitude of fractal dimensions on the incipient infinite cluster	95
5.4	Multifractals	99
5.5	Fractal models	103
5.6	Renormalization group for internal cluster structure	107
5.7	Continuum percolation, Swiss-cheese models and broad distributions	108
5.8	Elastic networks	111
	Further reading	113
6	Walks, Dynamics and Quantum Effects	115
6.1	Ants in the labyrinth	115
6.2	Probability distributions	122
6.3	Fractons and superlocalization	124
6.4	Hulls and external accessible perimeters	127
6.5	Diffusion fronts	130
6.6	Invasion percolation	133
	Further reading	135
7	Application to Thermal Phase Transitions	137
7.1	Statistical physics and the Ising model	137
7.2	Dilute magnets at low temperatures	139
7.3	History of droplet descriptions for fluids	140
7.4	Droplet definition for the Ising model in zero field	142
7.5	The trouble with Kertész	143
7.6	Applications	145
7.7	Dilute magnets at finite temperatures	146
7.8	Spin glasses	148
	Further reading	149
8	Summary	150
A	Numerical Techniques	153
A.1	Analysis of exact data	153
A.2	Analysis of Monte Carlo data	154
A.3	Computerized cluster counting	156
	Further reading	168
B	Dimension-Dependent Approximations	169
B.1	Upper critical dimension	169
B.2	Flory approximation	170
B.3	ϵ -Expansion	171
	Further reading	171
	Exercises	173
	Index	179
