

Preface xxv

PART 1

Life and Death of Microorganisms 1

1 Microbiology in the Biological World 2

Key Concepts 2

A Glimpse of History 3

Introduction 3

Microorganisms Discovered 3

The Theory of Spontaneous Generation Was Revived with the
Discovery of the Microbial World 4

Perspective 1.1: Microbial Sleuthing 5

Medical Microbiology—Past Triumphs 6

Medical Microbiology—Future Challenges 7

Beneficial Applications of Microbiology—Past and Present 8

Biotechnology—New Applications for Microorganisms 8

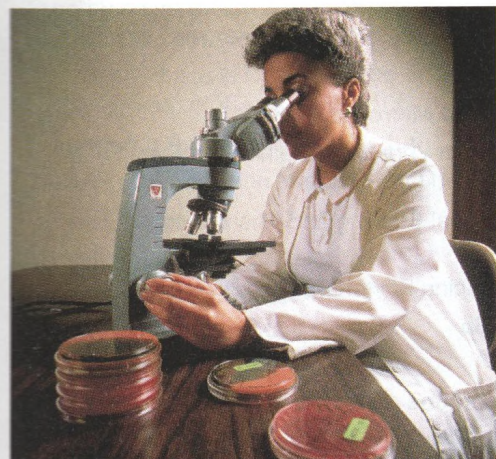

Review Questions 8

Cell Theory 8

Perspective 1.2: Cleaning up the Environment with Bacterial
Pac-Men 9

Similarity in Function and Composition of All Cells 9

Basic Cell Types 10

Perspective 1.3: Prokaryotes in the Guinness Book of
Records 12

Some Cell Types Appear to Be Intermediate Between
Prokaryotes and Eukaryotes 12

Bacteria Can Be Divided into Two Major Groups—the Eubacteria
and the Archaeobacteria 13

Eubacteria Include Most Bacteria Familiar to
Microbiologists 13

Archaeobacteria Often Grow Under Extreme Conditions of
Temperature and Salinity 14

Review Questions 14

Members of the Microbial World 15

Algae, Fungi, and Protozoa Are Eukaryotic Members of the
Microbial World 15

Viruses and Viroids Are Nonliving Members
of the Microbial World 17

Prions Are Nonliving Agents Whose Chemical Nature Is
Uncertain 18

Sizes of Members of the Microbial World 18

Nomenclature of Organisms 18

Review Questions 19

Summary 20

Critical Thinking Questions 21

Further Reading 21

2 Biochemistry of the Molecules of Life 22

Key Concepts 22

A Glimpse of History 23

Introduction 24

Elements and Atoms 24

Perspective 2.1: Isotopes—Valuable Tools for the Study
of Biological Systems 25

Formation of Molecules: Chemical Bonds 25

Covalent Bonds Are Formed when Atoms Share Electrons 26

Ionic Bonds Are Formed by the Loss and Gain of Electrons
Between Atoms 26

Hydrogen Bonds Are Weak but Biologically Very Important 27

Perspective 2.2: Water—The Universal Requirement for
Life 29

Review Questions 30

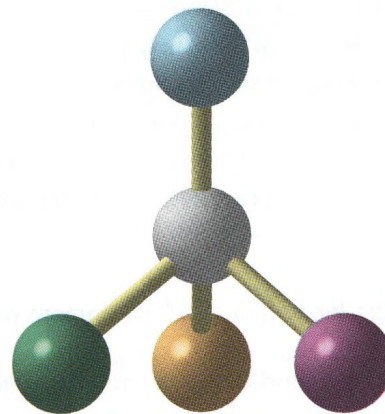

Important Molecules of Life 30

Small Molecules in the Cell Include a Variety of Inorganic and Organic Compounds	30
All Very Large Molecules in the Cell (Macromolecules) Consist of Repeating Subunits Called Monomers	30
Amino Acids Joined Together Make Up Proteins	32
Polysaccharides Are Polymers of Monosaccharide Subunits	36
Nucleic Acids Are Polymers of Nucleotide Subunits	38
Lipids Are Too Small and Heterogeneous to Be Classified as Macromolecules	40
Review Questions	43
Summary	44
Critical Thinking Questions	45
Further Reading	45

3 Functional Anatomy of Prokaryotes and Eukaryotes 46

Key Concepts	46
A Glimpse of History	47
Introduction	47
Microscopic Techniques: Instruments	47
The Compound Microscope Has Two Sets of Magnifying Lenses	47
The Contrast Between Cells and Their Surrounding Media Must Be Increased for Good Observations	49
Dark-field Microscopy Highlights Specimens Against a Dark Background	49
Fluorescence Microscopy Is Used to Examine Materials that Fluoresce	49
The Electron Microscope Can Resolve Objects a Thousand Times Better than the Light Microscope	49
Scanning Electron Microscope Allows a Three-dimensional View of the Object	51
The Scanning Tunneling Microscope Can Observe Individual Atoms on the Surface of Samples	51
Microscopic Techniques: Staining	51
Simple Staining Procedures Involve a Single Dye	52
Differential Stains Distinguish Various Kinds of Bacteria Because of Differences in Their Surface Structure	52
Review Questions	54
Shapes of Bacteria	54
Functions Required in Prokaryotic and Eukaryotic Cells	57
Prokaryotic and Eukaryotic Cells—Microscopic Appearance	57
Enclosure of Cytoplasm: Covering of the Cell	58
The Capsule or Slime Layer Is a Gelatinous Structure that Can Attach Bacteria to Surfaces	59
The Bacterial Cell Wall Is Rigid and Is Composed of Unique Chemical Structures	61
Most Eukaryotic Cells Have a Simple Wall Structure	66
Review Questions	66
The Cytoplasmic Membrane Is Flexible and Is Composed of a Lipid Bilayer in All Cells	66

The Cytoplasmic Membrane in Eukaryotic Cells Has the Same Basic Structure as that of Prokaryotic Cells	70
Generation of Energy in Eukaryotic Cells	70
Energy Is Generated by Mitochondria and Chloroplasts	71
Cell Movement—Prokaryotic Cells	73
Flagella Have a Relatively Simple Structure in Bacteria	73
Cell Movement—Eukaryotic Cells	76
Cell Attachment	77
Pili Are Protein Appendages of Attachment	77
Review Questions	78
Storage of Genetic Information	78
The Bacterial Chromosome Is a Long, Double-stranded, Circular DNA Molecule	78
Plasmids Are Small DNA Molecules that Code for Nonessential Information	78
Perspective 3.1: Plasmids, Pasteur, and Anthrax	79
In Eukaryotic Cells, Genetic Information Is Contained in Multiple Chromosomes	80
Synthesis of Protein	80
Ribosomes Are Workbenches on Which Proteins Are Synthesized	81
Many Antibiotics Inhibit the Correct Functioning of Prokaryotic but Not Eukaryotic Ribosomes	81
Storage Materials	81
Perspective 3.2: Antibiotic Action and Evolution	82
Endospores	82
Perspective 3.3: Ancient Microbes	83
Endospores Develop from Vegetative Cells when They Face Starvation	84
Endospores Have Unusual Staining and Resistance Properties	85
Many Endospore-producing Bacteria Cause Disease	85
Review Questions	85
Summary	86
Critical Thinking Questions	87
Further Reading	87

4 Dynamics of Bacterial Growth 88

Key Concepts 88

A Glimpse of History 89

Introduction 89

Pure Culture Methods 89

Measurement of Cell Growth 90

Bacterial Growth Is Defined in Terms of Population Size 91

Growth Can Be Measured as an Increase in Mass (Weight) of the Population 92

Growth Can Be Measured as an Increase in Cell Number 92

Review Questions 93

Multiplication of Microorganisms—General Aspects 93

Factors Influencing Microbial Growth 93

The Environmental Factors that Influence Growth Include Temperature, Oxygen, pH, and Osmotic Pressure 93

Review Questions 97

Nutritional Aspects of Bacterial Growth 98

Cell Multiplication Requires a Source of Energy and Raw Material for Synthesis of Cell Components 98

Cultivation of Bacteria in the Laboratory 99

The Two Kinds of Media on Which Bacteria Are Grown Are Synthetic (Defined) and Complex (Undefined) 99

Anaerobes Require Special Cultivation Methods 101

Cultivation of Organisms that Occur as a Minor Part of the Microbial Population 102

Enrichment Cultures Enhance the Growth of Specific Organisms 102

Selective Media Preferentially Inhibit the Growth of Certain Organisms 102

Differential Media Serve as Useful Diagnostic Aids 103

Perspective 4.1: Bismuth Subsalicylate—A Medicine with Magical Properties 104

Dynamics of Bacterial Population Growth 104

The Lag Phase of Growth Involves No Increase in Cell Numbers 104

The Exponential Phase of Growth Results in an Exponential Increase in Cell Number 105

The Stationary Phase Is Reached when the Number of Viable Cells Stops Increasing 106

The Death Phase Is Characterized by an Exponential Decrease in the Number of Viable Cells 106

Growth of a Bacterial Colony 106

Growth of Bacteria in Nature—An Open System 106

Review Questions 107

Summary 107

Critical Thinking Questions 109

Further Reading 109

5 Metabolism: The Generation of Energy and Synthesis of Small Molecules 110

Key Concepts 110

A Glimpse of History 111

Introduction 111

Enzymes—Chemical Kinetics and Mechanisms of Action 112

Enzymes Speed Up Reactions by Lowering Their Activation Energy 112

The Shape of the Substrate Must Fit the Shape of the Enzyme that Acts on It 112

Environmental and Chemical Factors Influence Enzyme Activity 113

Energy Metabolism—Introduction 114

Perspective 5.1: Taking Enzymes to the Cleaners 115

Glucose Degradation Yields Energy and Reducing Power, Which Cells Use to Make More Cells 116

Glycolysis Is the Most Common Pathway for Degrading Sugars 116

Review Questions 120

The TCA Cycle Oxidizes Pyruvic Acid to CO_2 and H_2O , and Traps the Energy of Pyruvic Acid in ATP 120

Oxidative Phosphorylation Produces Energy by Electron Transfer 121

Much More Energy Is Gained in Respiration than in Fermentation 122

Respiration Under Anaerobic Conditions 122

Perspective 5.2: Electron Transport and Energy Production 123

Metabolism of Compounds Other than Glucose 123

Other Pathways of Glucose Degradation 124

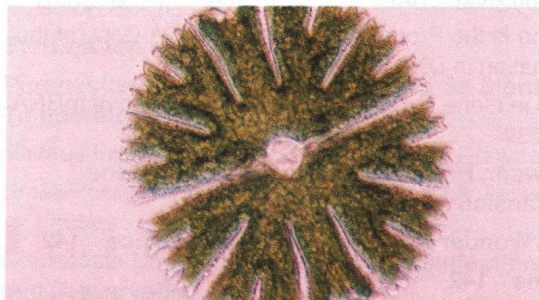

Oxidation of Inorganic Compounds 124

Biosynthetic Metabolism (Anabolism) 124

Degradative and Biosynthetic Pathways May Be Part of the Same Pathway 124

Perspective 5.3: Plastics, Landfills, and Bacteria 125

Many Amino Acids Are Synthesized from the Same Precursor Metabolites 126

Purines and Pyrimidines Are Synthesized Stepwise Along Different Pathways 127

Bacterial Photosynthesis 128

Light Energy Absorbed by Chlorophyll Provides Energy to Reduce CO₂ to Cell Material 128

Compounds Other than H₂O Serve as the Reducing Agent in Photosynthetic Bacteria Other than Cyanobacteria 128

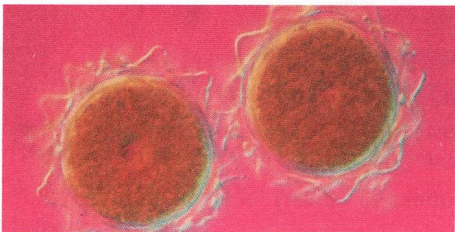

Photosynthesis Requires Light for Energy Generation but Biosynthetic Reactions Do Not 128

Review Questions 129

Summary 129

Critical Thinking Questions 131

Further Reading 131

6 Informational Macromolecules: Function, Synthesis, and Regulation of Activity 132

Key Concepts 132

A Glimpse of History 133

Introduction 133

Chemistry of DNA and RNA 133

DNA Is a Double-stranded, Helical Molecule 134

The Two Strands of DNA Are Oriented in Opposite Directions 134

RNA Is Usually Single-stranded and Not as Long as DNA 134

Information Storage and Transfer—Overview 135

DNA Replication Begins at a Specific Site on the Bacterial Chromosome and Proceeds by the Sequential Addition of Nucleotides 136

The Expression of Genes 136

The Sequence of Three Nucleotides in mRNA Determines a Specific Amino Acid 136

Gene Transcription Is the Process of Making an RNA Copy of the Genetic Information in DNA 136

The Second Step in Gene Expression Is the Translation of mRNA into Protein 139

Differences Between Prokaryotic and Eukaryotic Gene Transcription/Translation 141

Perspective 6.1: Wonder Foods and Virus Resistance 142

Review Questions 142

Perspective 6.2: RNA—The First Macromolecule? 143

The Environment and Control Systems—Overview 144

Mechanisms of Control of Biosynthetic Pathways—Overview 144

End Product Repression Controls the Start of Gene Transcription 144

End Products Control the Activity of the First Enzyme of the Pathway—Allosteric Control 145

Mechanisms of Control of Degradative Pathways 147

Metabolites that Can Be Degraded Activate the Genes Responsible for Their Degradation 147

Catabolite Repression Ensures Efficient Use of Available Foodstuffs 148

Review Questions 149

Summary 150

Critical Thinking Questions 151

Further Reading 151

7 Bacterial Genetics 152

Key Concepts 152

A Glimpse of History 153

Introduction 153

Source of Diversity in Microorganisms 154

Gene Alterations—Mutations 154

Mutations Can Occur by Substitution of One Base for Another 154

Mutations Can Occur by the Removal or Addition of Nucleotides 154

Mutagenesis 155

Chemical Mutagens Often Act by Altering the Hydrogen-bonding Properties of the Nitrogenous Bases 156

Transposable Elements (Jumping Genes) 156

Ultraviolet Irradiation 157

Perspective 7.1: Barbara McClintock: The Discoverer of Jumping Genes 158

Repair of Damaged DNA 159

UV Damage Can Be Overcome by an Inducible Enzyme System of DNA Replication that Makes Many Mistakes 160

Visible Light Activates an Enzyme that Breaks Covalent Bonds, Forming Thymine Dimers 160

Bacteria Can Excise Damaged DNA and Replace It with Undamaged DNA 160

Rates of Mutation 161

Mutations Are Expressed Rapidly in Prokaryotic Cells 161

Mutant Selection 161

Direct Selection Requires that the Mutant Grow on a Medium on Which the Parent Cannot 162

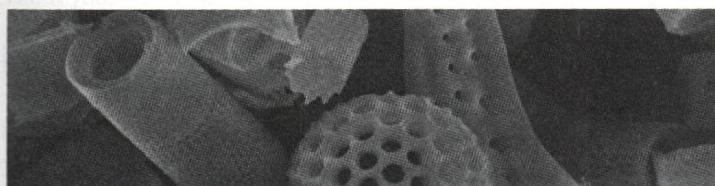

Indirect Selection Must Be Used to Isolate Mutants that Cannot Grow on a Medium on Which the Parent Can Grow 162

Conditional Lethal Mutants 163

Chemicals Can Be Tested for Their Cancer-causing Ability by Their Mutagenic Activity 163

Perspective 7.2: Commercial Applications of Mutants 164

Review Questions	165
Mechanisms of Gene Transfer—General Aspects	165
Gene Transfer Between Bacteria	165
DNA-mediated Transformation Involves the Transfer of Naked DNA from Donor Cells to Recipient Cells	166
Transduction Involves Viral Transfer of DNA	168
Conjugation Requires Cell-to-cell Contact	168
Review Questions	172
Plasmids	172
R Factor Plasmids Confer Resistance to a Large Number of Antimicrobial Agents	173
Perspective 7.3: Bacteria Can Conjugate with Plants	174
Gene Transfer Within the Same Bacterium	175
Transposable Elements Are Important for the Transfer of Genes to Unrelated Bacteria	175
Restriction and Modification of DNA	175
Modification Enzymes Confer Resistance to Restriction Enzymes	176
Importance of Gene Transfer to Bacteria	176
Importance of Gene Transfer to the Microbial Geneticist	177
Review Questions	177
Summary	177
Critical Thinking Questions	179
Further Reading	179

8 Microbiology and Biotechnology 180

Key Concepts	180
A Glimpse of History	181
Introduction	181
The Basic Features of Genetic Engineering	182
A Common Method of Gene Cloning Involves the “Shotgun” Technique	182
Step 1—The Human Cells Are Broken Up to Release All of Their DNA	182
Step 2—The Construction of Recombinant DNA Molecules Involves Restriction Enzymes	182
Step 3—Recombinant Molecules Must Be Introduced into a Host Organism	185
Perspective 8.1: Agarose Gel Electrophoresis	186
Step 4—Host Cells Containing Recombinant DNA Can Be Selected on the Basis of the Properties Conferred by the Vector	186

Step 5—Identifying the Recombinant Clone of Interest Often Involves the Use of Nucleic Acid Probes	187
Expression of Cloned Genes	188
Applications of Genetic Engineering in Biotechnology	188
Medically Important Proteins Can Be Produced by <i>E. coli</i> and Yeast	189
Additional Applications of Biotechnology	190
Bioremediation Involves the Use of Microorganisms to Degrade Harmful Chemicals	190
Toxins from Bacteria Can Serve as Effective Biocontrol Agents	190
In Plant Genetic Engineering, Genes Are Introduced into Plants by <i>Agrobacterium</i>	191
Biotechnology and the Polymerase Chain Reaction	192
Review Questions	193
Perspective 8.2: Science Takes the Witness Stand	194
Summary	195
Critical Thinking Questions	196
Further Reading	196

9 Control of Microbial Growth 197

Key Concepts	197
A Glimpse of History	198
Introduction	198
Approaches to Control	198
Sterilization Is the Process of Removing or Killing Microorganisms and Viruses	198
Disinfection Reduces the Number of Pathogens	198
Principles Involved in Killing Microorganisms	199
Killing Microorganisms and Viruses by Using Heat	199
Heat Kills by Coagulating the Proteins of Cells and Viruses	200
Dry Heat Requires More Time than Wet Heat to Kill Microorganisms	200
Boiling Kills Most Vegetative Cells but Not Bacterial Endospores	200
Pressure Cookers and Autoclaves Are Effective Sterilizers	200
Review Questions	202
Using an Autoclave	202
Pasteurization Involves Controlled Heating at Temperatures Below Boiling	203
Sterilization by Filtration	203
Perspective 9.1: Some Materials Can Be Sterilized by Temperatures Below Boiling	204
Various Filter Types May Have Important Drawbacks	204
Small Pore Size Membrane Filters Are Able to Remove Viruses	204
Chemicals Used For Sterilization, Disinfection, and Preservation	205
The Germicidal Activity of Chemicals Can Be Ranked as “High,” “Medium,” or “Low”	205

A Number of Chemical Families Provide Useful Germicides 206

Perspective 9.2: Formaldehyde Pollution of Household Air 207

Perspective 9.3: Contamination of an Operating Room by a Bacterial Pathogen 208

Perspective 9.4: Mercury Poisoning from Latex Paint 209

Review Questions 210

Germicidal Chemicals Used in Medical Fields Are Federally Regulated 210

Perspective 9.5: Disinfection of Spilled Blood 211

Chemicals Are Useful as Preservatives 211

Perspective 9.6: Comparison of Sterilizing and Disinfecting Techniques 212

Perspective 9.7: Use of Radiation for Disinfecting and Sterilizing Food 213

Radiation 213

Gamma Rays Cause Biological Damage by Producing Hyperactive Ions 213

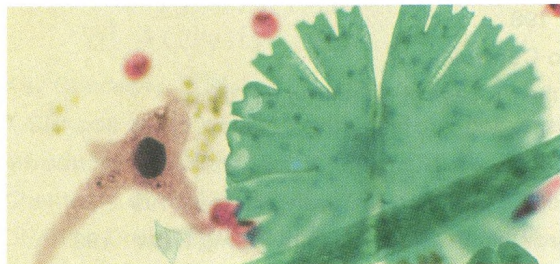

Ultraviolet Radiation Damages Nucleic Acids 214

Review Questions 214

Summary 214

Critical Thinking Questions 215

Further Reading 215

PART 2

Microbial World 217

10 Classification and Identification of Bacteria 218

Key Concepts 218

A Glimpse of History 219

Introduction 219

Problems in Classifying Microorganisms 219

Perspective 10.1: *Escherichia coli*, O157:H7, Hamburgers, and Food Poisoning 220

Present Day Classification Schemes 220

Numerical Taxonomy 221

Molecular Approaches to Taxonomy 221

DNA Base Compositions of Organisms Indicate Whether or Not They May Be Related 222

Comparing Sequence of Bases in DNA Determines How Closely Organisms Are Related to One Another 222

Amino Acid Sequence Similarities in the Same Protein Can Indicate Relatedness Between Organisms 223

Determination of the Base Sequences in 16S Ribosomal RNA Reveals Evolutionary Relationships Between Diverse Groups of Bacteria 225

Review Questions 225

Methods of Identifying Bacteria 227

Direct Methods of Identification Involve Microscopic Examination Without Culturing the Organisms 227

Perspective 10.2: Surprising Relationships 228

Culture Techniques Involve Growing the Unknown Organism in Pure Culture 230

Detecting Products of Metabolism May Be Easier and Faster than Culturing The Organism 231

Molecular Approaches in Diagnostic Microbiology Usually Involve Analysis of DNA 231

Microorganisms that Cannot Be Cultured Can Still Be Identified 233

Review Questions 235

Summary 235

Critical Thinking Questions 236

Further Reading 236

11 Prokaryotic Microorganisms: Eubacteria and Archaeobacteria 237

Key Concepts 237

A Glimpse of History 238

Introduction 238

Prokaryotes with a Gram-negative Type of Cell Wall 238

The Spirochetes Have a Distinctive Shape and Unusual Mechanism of Motility 238

The Aerobic Motile, Helical, or Comma-shaped Gram-negative Bacteria Have Rigid Cell Walls and Flagella 240

Gram-negative Aerobic Rods and Cocci Represent a Large and Diverse Group of Prokaryotes 241

Review Questions 243

Facultatively Anaerobic Gram-negative Rods Are Represented by Enterobacteria and Vibrios 243

Most Fermentative Anaerobic Gram-negative Straight, Curved, and Helical Rods Inhabit Animal Digestive Tracts 244

The Dissimilatory Sulfate- or Sulfur-reducing Bacteria Generally Live in Mud Rich in Organic Material and Oxidized Sulfur Compounds 244

The Rickettsias and Chlamydias Are Obligate Intracellular Parasites 245

Review Questions 247

Endosymbionts Are Microorganisms that Have Established a Stable Intracellular Relationship with a Eukaryotic Host Cell 247

Non-Photosynthetic, Gliding Bacteria Are Widespread in the Environment and May Be Found in the Human Mouth 248

Myxobacteria are Fruiting, Gliding Bacteria 249

Sheathed Bacteria Are Enclosed in a Lipoprotein-polysaccharide Material 249

Anoxygenic Phototrophic Bacteria Carry on Photosynthesis without Releasing Oxygen 250

Oxygenic Photosynthetic Bacteria Liberate Oxygen as a By-product of Their Photosynthesis 251

Budding and/or Appendaged Bacteria Are Characterized by Cytoplasm-filled Projections from the Main Cell Body 252

Many Aerobic Chemolithotrophic Bacteria Can Grow in the Dark on Media Containing Only Inorganic Substances 253

Review Questions 254

Prokaryotes with a Gram-positive Type of Cell Wall 254

Gram-positive Cocci Comprise a Large Group, Subdivided on the Basis of Arrangement of Cells and Metabolic Differences 255

Only a Few Genera of Gram-positive Rods and Cocci Are Endospore-forming 256

Some Cylindrical Gram-positive Rods Do Not Form Endospores 256

The Irregularly Shaped, Non-spore-forming, Gram-positive Rods Include Many Unrelated Genera 257

The Mycobacteria Demonstrate the Acid-fast Staining Property 258

Many Species of Branching, Gram-positive Bacteria (“Actinomycetes”) Have Aerial and Specialized Hyphae 259

Prokaryotes that Lack Cell Walls 262

The Mycoplasmas Are Very Small Prokaryotes Bounded Only by a Plasma Membrane 262

Prokaryotes Whose Cell Walls Lack Peptidoglycan 264

Archaeobacteria Differ from Eubacteria in Many Respects 264

Review Questions 266

Summary 267

Critical Thinking Questions 268

Further Reading 268

12 Eukaryotic Microorganisms: Algae, Fungi, and Protozoa 269

Key Concepts 269

A Glimpse of History 270

Introduction 270

Algae 270

Algae Are Classified According to Their Photosynthetic Pigments 272

Algae Occur in a Variety of Habitats and Can Be Either Microscopic or Macroscopic 272

Perspective 12.1: Could the Algae Growing in the Ocean Be More Important to Global Warming than Tropical Rain Forests? 273

Algae Are Typical Eukaryotic Organisms 274

Algae Reproduce by Both Asexual and Sexual Means 275

Some Algal Species Produce Toxins that Cause Paralytic Shellfish Poisoning 278

Review Questions 278

Fungi 278

Fungi Occur in Diverse Habitats 278

Most Fungi Are Aerobic Heterotrophic Organisms 279

The Terms *Yeast*, *Molds*, and *Mushrooms* Are Common Names that Refer to Various Fungal Forms 279

Classification of Fungi Is Revised Frequently 282

Perspective 12.2: *Pneumocystis carinii*—Protozoan or Fungus? 283

Fungi Cause Disease in Humans 283

Perspective 12.3: The Salem Witch Hunts 284

Some Fungi Form Symbiotic Relationships with Other Organisms 284

Fungi Are Economically Important Organisms Both for the Good They Do and the Damage They Cause 285

Review Questions 286

Protozoa 286

Protozoan Habitats Are Diverse 286

Protozoan Classification Is Based Primarily on the Presence or Absence of Organelles of Locomotion 286

Protozoa Lack a Cell Wall 287

Polymorphism Is Often a Feature of the Protozoan Life Cycle 288

Protozoa Ingest Foodstuffs by Either Phagocytosis or Pinocytosis 288

Reproduction Can Be Either Asexual or Sexual 289

Protozoa Are Important in the Food Chain and in the Control of Other Microorganisms 289

Protozoa Cause a Number of Serious Diseases in Humans 290

Review Questions 290

Summary 290

Perspective 12.4: Hikers Beware! Is that Clear Mountain Stream Really Clear? 291

Critical Thinking Questions 292

Further Reading 292

13 The Nature and Study of Viruses 293

Key Concepts 293

A Glimpse of History 294

Viruses—General Characteristics 294

The Nucleic Acids in Viruses Can Be DNA or RNA, but Never Both 294

Viruses Can Only Grow Within Living Cells 294

Virus Architecture 295

Perspective 13.1: Mad Cows and Englishmen 297

Bacteriophages Can Be Conveniently Grouped on the Basis of Their Structure and Host Cells 297

Virus-Host Relationships Exemplified by Phage-Bacterial Interactions 297

Virus Replication in a Productive Infection Is Often Followed by Cell Lysis 298

Step 1: Phages Attach to Host Bacterial Cell Receptors 299

Step 2: Viral Nucleic Acid Enters the Host Cell 299

Step 3: Phage DNA Is Transcribed Leading to Production of Specific Proteins 300

Step 4: Phage DNA Replicates and Phage Structural Proteins Are Synthesized Separately 300

Step 5: Phage DNA and Protein Assemble to Form Mature Virions—The Maturation Process 300

Step 6: Virions Are Released from the Host Cell 300

Phage Growth—One-step Growth Curve 300

Perspective 13.2: Viral Soup 302

Review Questions 302

Virus Replication in a Latent State 302

The DNA of Temperate Viruses Is Integrated into the Host Chromosome 302

The Integration of Phage DNA into the Bacterial Chromosome Occurs Because of Identical DNA Sequences in Both 304

Repressor Must Function Continuously to Keep Prophage Integrated 304

Activation of SOS Repair System Destroys the Repressor 304

Lysogens Are Immune to Infection by the Same Phage 304

Filamentous Phages Are Released Without Killing the Host Cell 305

Transduction 305

Generalized Transduction Is Carried Out by Phages as They Undergo a Productive Infection 305

Specialized Transduction Is Only Carried Out by Temperate Phages 305

Host Range of Viruses 307

Methods Used to Study Viruses 308

Many Host Cells Can Be Cultivated in the Laboratory 308

Animal Viruses Can Also Form Plaque 309

Virus Infection of Cells May Change Their Appearance 309

Counting of Virions with the Electron Microscope Can Determine the Number of Virions 310

Quantal Assays Measure the Number of Infective Virions 310

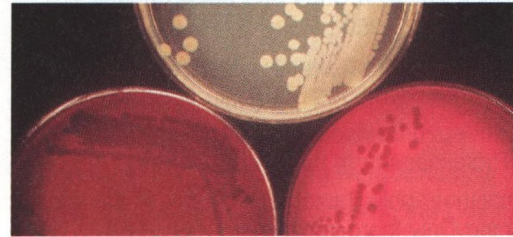

The Ability of Some Viruses to Clump Red Blood Cells Can Be Used to Measure Their Concentration 311

Review Questions 311

Summary 311

Critical Thinking Questions 312

Further Reading 312

14 Viruses of Animals and Plants 313

Key Concepts 313

A Glimpse of History 314

Introduction 314

Classification Scheme of Animal Viruses 314

Virus Interaction with Animal Cells 314

Virus Multiplication 315

The First Step in Infection Is Adsorption of the Virus to the Host Cell 315

Viral Entry Often Involves Fusion of the Cytoplasmic Membrane of the Host with the Virion Envelope 315

The Replication of Viral Nucleic Acid Depends to Varying Degrees on Enzymes of the Host Cell 315

Maturation of Virions Involves Self-assembly of Viral Component Parts 317

Virions Are Released as a Result of Lysis of Dead Cells or by Budding from Living Cells 318

Interactions of Animal Viruses with Their Hosts—Overview 319

Acute Infections Result in Readily Observed Disease Symptoms that Disappear Quickly 319

In Persistent Infections, the Virus Is Present for Many Years Without Any Disease Symptoms 319

Latent Viral Infections May Result from Integration of Viral DNA into Host Cell DNA 320

Review Questions 320

Viruses and Tumors in Animals 321

Perspective 14.1: The Immortal Henrietta Lacks 322

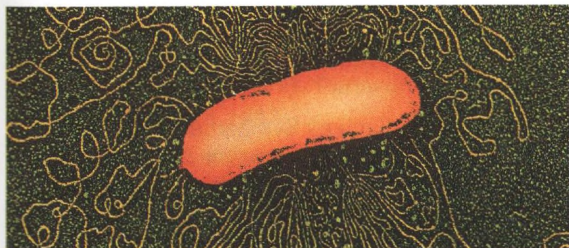

Tumors Caused by DNA Viruses Result from Integration and Expression of Viral DNA in the Host Cells 322

Tumors Caused by RNA Viruses Involve the Making of a DNA Copy of the Viral RNA, Which Is then Integrated into the Chromosome of the Host Cell 323

Viruses and Tumors in Humans 324

Three Groups of DNA Viruses Have Been Shown to Cause Tumors in Humans 324

A Rare Human Leukemia Is Caused by a Retrovirus 324
HIV Disease (AIDS) 324
Viruses that Cause Diseases of Plants 325
 Plant Viruses Are Spread by a Variety of Mechanisms 325
Insect Viruses 327
Viroids 328
Review Questions 328
Summary 328
Critical Thinking Questions 329
Further Reading 329

PART 3

Microorganisms and Humans 331

15 Interactions Between Humans and Microorganisms 332

Key Concepts 332
A Glimpse of History 333
Introduction 333
The Host Defends Itself: Nonspecific and Specific Defense Mechanisms 333
Normal Flora of the Human Body 334
 Microorganisms and Humans Form a Variety of Symbiotic Relationships 334
 Establishing and Maintaining the Normal Flora as a Dynamic Human-Microbe Ecosystem Is Important for Good Health 335
Infectious Disease Terminology 336
Review Questions 337
Perspective 15.1: Robert Koch and His Postulates 338
Mechanisms of Pathogenesis 338
 The Sources of Infectious Agents and Their Transmission Are Varied and Numerous 338
 Attachment Is Usually a Necessary Step in the Establishment of Infection 339
 The Establishment of Infection Usually Involves Invasion of Host Tissues 340
 Colonization Is a Necessary Step to Establishing an Infection 341
 Some Pathogens Can Evade or Thwart the Work of the Phagocytes 342

Extracellular Products May Be Responsible for Microorganisms' Ability to Cause Disease 343
Review Questions 345
Host Factors Influencing Resistance to Infection 346
 Circulating and Tissue Leukocytes Are Vital to Host Defenses 346
 Inflammation Represents a Series of Protective Tissue Responses 349
 Various Nonspecific Antimicrobial and Antiviral Substances Are Present in Body Fluids 350
 The Host's Metabolic Response Mobilizes the Body to Fight Infection 351
 Impaired Body Defenses Promote Infectious Disease 353
 Genetic Factors Are Important in Determining the Susceptibility of People to Certain Infections 353
 Age and Stress Are Also Factors that Determine Susceptibility to Infection 353
 Some Potential Pathogens May Live for Years in Host Tissues, Held in Check by Host Defenses 354
Review Questions 354
Summary 354
Critical Thinking Questions 355
Further Reading 355

16 Immunology: the Specific Immune Response—Antigens, Antibodies, and Cell-mediated Immunity 356

Key Concepts 356
A Glimpse of History 357
Introduction 357
Innate (Natural) and Acquired Immunity 357
 Innate Immunity Confers Disease Resistance that Does Not Involve the Production of Antibodies or Cellular Immunity 358
 Acquired Immunity Can Be Acquired Either Naturally or Artificially 358
The Nonspecific Response Versus the Specific Immune Response 359
 Nonspecific Immunity 359
 Specific Immunity 359
Antigens 359
 The Immune Response Is Directed Against Antigenic Determinants 359
 To Be Antigenic, Haptens Must Bind to Larger Molecules 361
 Most Antigens Must Be Modified by Antigen-processing Cells Before They Will Cause an Immune Response 361
Review Questions 361
The Duality of the Specific Immune Response 361
The Cells Involved in the Specific Immune Response 362
B Cells and the Antibody Response 362
 Clonal Expansion Allows for an Increased Immune Response 365

Antibody Molecules Are Proteins Known as Immunoglobulins 365

Antigen-antibody Relationships Are Like a Lock and Key 366

Perspective 16.1: Each Different Kind of Antibody Molecule Results from Rearrangements of Genes in Antibody-producing Cells 367

There are Five Classes of Immunoglobulins 368

Perspective 16.2: Monoclonal Antibodies 371

Review Questions 372

T Cell Response and Cell-mediated Immunity 372

T Cells Have Antibody-like Receptors that Interact Specifically with Antigenic Determinants 372

Three Types of T Cells Are of Special Importance 373

Other Cells Are Also Involved in Cell-mediated Immunity 375

The Commonality of the Two Divisions of the Specific Immune Response 375

The Secondary (Anamnestic) Response and Vaccination 376

Perspective 16.3: Superantigens 377

Immunological Tolerance 378

Recognition of Self by the Immune System Occurs During Fetal Development 379

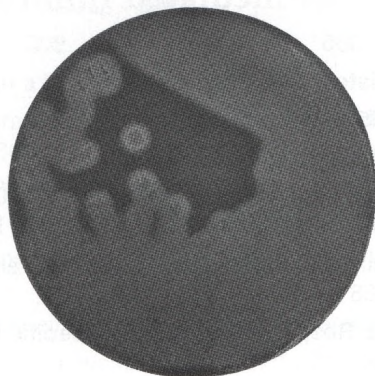

Regulation of the Immune Response 379

Review Questions 379

Summary 380

Critical Thinking Questions 381

Further Reading 381

17 Immunology: Disorders of the Immune System 382

Key Concepts 382

A Glimpse of History 383

Introduction 383

Immunodeficiency Diseases 383

Primary Immunodeficiency Disease Is Caused by a Genetic Defect 383

Secondary Immunodeficiency Disease Is Not the Result of a Genetic Defect but Is Acquired Later in Life 384

Hypersensitivities 385

Type I, or Immediate, Hypersensitivities Are IgE Mediated 385

Type II Hypersensitivity or Cytotoxic Reactions Are Caused by Humoral Antibodies that Can Destroy Normal Cells 387

Type III Hypersensitivity or Immune Complex Reactions Activate Inflammatory Mechanisms 389

Type IV, or Delayed, Hypersensitivity Involves T Lymphocytes and Cell-mediated Immunity 390

Transplantation 392

Immunity to Cancers Involves Mechanisms of Cell-mediated Immunity 392

Perspective 17.1: Major Histocompatibility Complex 393

Review Questions 393

Autoimmune Diseases 393

Some Autoimmune Diseases, Such as Myasthenia Gravis, Are Caused by the Production of Antibodies to Structures Within the Body 394

Some Autoimmune Diseases, Such as Sympathetic Ophthalmia, May Be Mediated by Delayed Hypersensitivity 394

Immunology and Diagnostic Testing Techniques 394

Precipitation Reactions 395

Agglutination Reactions Are Similar to Precipitation Reactions Except that They Involve Particulate as Opposed to Dissolved Antigen 397

Complement Fixation Test Involves a Specific Antibody Acting Together with Complement to Cause Cell Lysis 398

Immunofluorescence Enhances Detection of Reactions 398

Radioimmunoassay (RIA) and Enzyme-linked Immunosorbent Assay (ELISA) 399

Review Questions 400

Summary 400

Critical Thinking Questions 401

Further Reading 401

18 Epidemiology and Public Health 402

Key Concepts 402

A Glimpse of History 403

Introduction 403

Infectious Disease Epidemics: Origin and Spread 403

To Determine the Cause of an Epidemic One Must First Define the Population Involved 404

Precise Identification of Infectious Agents Is Often Essential 404

The Reservoir of an Infectious Agent Is the Sum of Possible Sources of the Agent 407

Spread of an Epidemic Is Influenced by Vectors, Incubation Period, Infecting Dose, and Other Factors 407

Air Can Be a Vehicle for Infectious Agents 408

Perspective 18.1: Tuberculosis Epidemic in a Hospital 409

Water and Food Are Important Vehicles for Infectious Agents 410

Person-to-person Transmission Can Be Interrupted by Simple Measures 410

Perspective 18.2: A Legionnaires' Disease Outbreak Originating in a Grocery Store 411

Carriers Are Apparently Healthy Individuals Colonized by Potential Pathogens 411

Review Questions 411

Population Characteristics 411

Perspective 18.3: Listeriosis Epidemic from Soft Cheese 412

Prior Exposure Influences the Level of Acquired Immunity to Infectious Agents 412

The Genetic Background of a Population Can Influence Susceptibility to Infection 413

Nutrition, Crowding, and Other Environmental and Cultural Factors Can Shape the Character of Epidemics 413

The Infecting Agent 413

Epidemic Severity Depends Partly on the Virulence of the Infectious Agent 413

The Intensity of Exposure to an Epidemic Agent Influences Frequency, Incubation Period, and Severity of Disease 413

Approaches to Control of Infectious Diseases 414

Resistance to Infection Is Enhanced by Good Health and Active Immunization 414

The Infectious Disease Reservoir Is Reduced by Treating Patients and Carriers, and Killing Vectors 414

Infectious Diseases in Hospitals 414

Perspective 18.4: Control of Hospital Infections 415

Nosocomial Infections Are Those that Are Acquired in a Hospital 416

The Infectious Disease Control Network 416

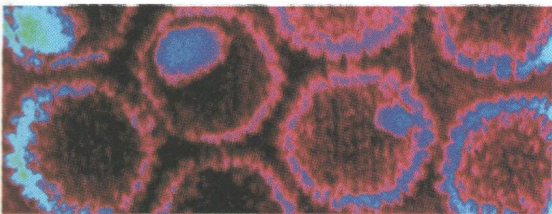

The Public Health Network Includes Schools, Hospital Laboratories, and News Media, as Well as Government Agencies 416

Review Questions 417

Summary 418

Critical Thinking Questions 419

Further Reading 419

19 Skin Infections 420

Key Concepts 420

A Glimpse of History 421

Introduction 421

Anatomy and Physiology 421

Normal Flora of the Skin 423

Normal Skin Flora Includes the Diphtheroids, a Group of Gram-positive Non-spore-forming Rods 423

Staphylococci Are Gram-positive Cocci that Are Generally Arranged in Clusters 424

Species of Single-celled Fungi (Yeasts) Are Generally Represented Among the Skin Flora 424

Review Questions 424

Skin Diseases Caused by Bacteria 424

Perspective 19.1: Laboratory Identification of *Staphylococcus aureus* 425

Infections of the Hair Follicles Cause Folliculitis, Furuncles, and Carbuncles 425

Scalded Skin Syndrome Is Also Caused by *Staphylococcus aureus* 427

Streptococcal Pyoderma Can Result in Acute Glomerulonephritis 429

Rocky Mountain Spotted Fever Is a Serious Tick-borne Disease Caused by an Obligate Intracellular Bacterium 431

Lyme Disease Is a Chronic Tick-borne Spirochetal Disease 433

Perspective 19.2: Lyme Disease in California 436

Review Questions 436

Skin Diseases Caused by Viruses 436

Varicella (Chicken Pox) Is Caused by a Virus that Remains Latent in the Body After Recovery 437

Perspective 19.3: Shingles Patient Starts Chicken Pox Epidemic 439

Rubeola (Measles) Is Often Complicated by Secondary Bacterial Infections 439

Perspective 19.4: Measles Sparks a Massacre 442

The Most Serious Consequence of Rubella Is Birth Defects 442

There Are Many Other Childhood Viral Exanthems 444

Warts Are Skin Tumors Caused by Papillomaviruses 445

Skin Diseases Caused by Fungi 445

Review Questions 446

Summary 447

Critical Thinking Questions 448

20 Upper Respiratory System Infections 449

Key Concepts 449

A Glimpse of History 450

Introduction 450

Anatomy and Physiology 450

The Movement of Mucus by Cilia Is Important in the Removal of Microorganisms and Other Foreign Material 452

Upper Respiratory Tract Functions Include Regulation of the Temperature and Humidity of Inspired Air 452

Normal Flora of the Upper Respiratory System 452

The Normal Bacterial Flora Includes Potentially Pathogenic Species 452

Review Questions 453

Bacterial Infections of the Upper Respiratory System 453

Streptococcal Pharyngitis (Strep Throat) Can Cause Serious Complications, Including Rheumatic Fever and Glomerulonephritis 454

Perspective 20.1: Scientist of Distinction: Rebecca Lancefield 457

Diphtheria Is a Deadly Toxin-mediated Disease 460

Perspective 20.2: Diphtheria Takes the Life of a 62-year-old Man 461**Review Questions 463**

Otitis Media and Sinusitis Typically Arise from Nasopharyngeal Infections 463

Haemophilus influenzae and *Streptococcus pneumoniae* Are Common Causes of Bacterial Conjunctivitis (Pink Eye) 464

Viral Infections of Upper Respiratory System 465

Colds Are Caused by a Large Number of Different Viruses 465

Perspective 20.3: Laboratory Diagnosis of Rhinovirus Infections 466**Perspective 20.4: Does a Cold Temperature Cause Colds? 466****Perspective 20.5: Cold Medicines Are of Doubtful Value and Some May Be Harmful 467**

Adenoviral Pharyngitis Resembles Strep Throat 467

Review Questions 468**Summary 468****Critical Thinking Questions 469****Further Reading 469**

Mycoplasma pneumoniae Is a Common Cause of Walking Pneumonia 475

Perspective 21.2: Laboratory Diagnosis of *Klebsiella* Pneumonia 476**Perspective 21.3: Laboratory Diagnosis of Mycoplasmal Pneumonia 478****Other Bacterial Infections of the Lower Respiratory Tract 478**

Pertussis Is Caused by *Bordetella pertussis* 478

Perspective 21.4: Laboratory Diagnosis of Pertussis 479**Review Questions 481**

Tuberculosis Is Typically a Chronic Disease 481

Perspective 21.5: Laboratory Diagnosis of Tuberculosis 483

Legionnaires' Disease Is a Bacterial Lung Infection Acquired by Inhaling Aerosols of Contaminated Water 485

Perspective 21.6: Laboratory Diagnosis of Legionnaires' Disease 486**Perspective 21.7: Hantavirus Pulmonary Syndrome 487****Viral Infections of the Lower Respiratory Tract 487**

Influenza Is a Lung Infection that Occurs in Pandemics About Every Ten Years 487

Fungal Infections of the Lung 491

Coccidioidomycosis Is Caused by a Soil Fungus Occurring in Certain Hot, Dry Regions of the Americas 492

Histoplasmosis Is Associated with Bird and Bat Droppings 493

Review Questions 495**Summary 495****Critical Thinking Questions 496****Further Reading 496**

22 Upper Alimentary System Infections 497

Key Concepts 497**A Glimpse of History 498****Introduction 498****Anatomy and Physiology 498**

The Initial Breakdown of Complex Foods Occurs in the Mouth Through the Action of Teeth and Saliva 498

Perspective 22.1: Role of Saliva in Preventing Tooth Decay 499

The Esophagus Functions to Convey Food Through the Chest Cavity to the Stomach 499

Hydrochloric Acid and the Protein-splitting Enzyme Pepsin Are Secreted by the Stomach and Continue the Breakdown of Food 500

Normal Flora 500

Colonization of the Mouth Depends upon the Ability of Microorganisms to Adhere to Oral Surfaces 500

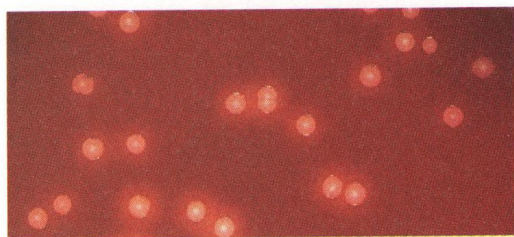

21 Lower Respiratory System Infections 470

Key Concepts 470**A Glimpse of History 471****Introduction 471****Anatomy and Physiology 471****Normal Flora 471****Bacterial Pneumonias 472**

Streptococcus pneumoniae Is One of the Most Common Causes of Bacterial Pneumonia 472

Perspective 21.1: Laboratory Diagnosis of Pneumococcal Pneumonia 473

Pneumonia Caused by *Klebsiella* Species Can Result in Permanent Lung Damage 474

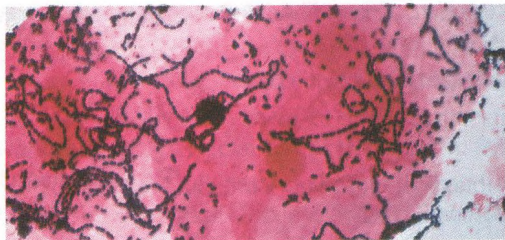

Infectious Diseases Caused by Oral Bacteria	501
Dental Caries Is a Chronic Infectious Disease of the Teeth Caused by Mouth Bacteria	501
Perspective 22.2: Sealants	503
Dental Plaque Causes Periodontal Disease, the Chief Cause of Tooth Loss in Older People	503
Trenchmouth Is an Acute Form of Gingivitis with Bacterial Invasion	504
Perspective 22.3: U.S. Dental Health Objectives	505
Oral Bacteria Can Cause Endocarditis, a Serious Heart Infection	505
Review Questions	505
Viral Diseases of the Mouth and Salivary Glands	506
The Mouth and Lips Are Common Sites of Herpes Simplex Virus Infections	506
Mumps Is a Viral Disease that Characteristically Involves the Parotid Glands	508
Perspective 22.4: Mumps Vaccine	509
Infections of the Esophagus and Stomach	509
Esophageal Infections Are Sometimes the First Indication of AIDS	509
Perspective 22.5: <i>Helicobacter pylori</i> and Stomach Cancer	510
<i>Helicobacter pylori</i> Gastritis Is a Common Stomach Ailment	510
Review Questions	511
Summary	512
Critical Thinking Questions	512
Further Reading	512

23 Lower Alimentary System Infections 513

Key Concepts	513
A Glimpse of History	514
Introduction	514
Anatomy and Physiology	514
The Liver Assists Digestion, Detoxifies Poisons, and Degrades Medications	514
The Pancreas Produces Insulin and Digestive Enzymes	515
The Small Intestine Has an Enormous Surface Area for Absorbing Nutrients, but It Also Has Great Secretory Ability	515

A Major Function of the Large Intestine Is to Recycle Intestinal Water and Absorb Nutrients	517
Normal Flora of the Digestive Tract	517
Intestinal Microorganisms Produce Vitamins and Inhibit Growth of Pathogens	517
Metabolic Effects of Intestinal Flora May Contribute to Human Discomfort and Disease	517
Infectious Intestinal Disease	518
Bacterial Diseases of the Digestive Tract	518
<i>Vibrio cholerae</i> Causes Cholera, a Life-threatening Toxin-mediated Diarrhea	518
Perspective 23.1: Toxigenic <i>Vibrio cholerae</i> 01 Infection Acquired in Colorado	520
Epithelial Invasion and Destruction Characterize Dysentery Caused by <i>Shigella</i> Species	520
Domestic Animals Are a Common Source of the <i>Salmonella</i> Strains that Cause Gastroenteritis	521
Perspective 23.2: Laboratory Diagnosis of Salmonellosis	522
Perspective 23.3: Salmonellosis Due to <i>Salmonella enteritidis</i> in Raw Eggs	523
Gastroenteritis Is Commonly Caused by Certain Strains of <i>Escherichia coli</i>	523
In the United States, <i>Campylobacter jejuni</i> Is One of the Common Bacterial Causes of Diarrhea	524
Typhoid Fever Is an Example of “Enteric Fever,” a Serious Form of <i>Salmonella</i> Infection	526
Review Questions	527
Food Poisoning	528
Staphylococcal Food Poisoning Is the Result of a Heat-resistant Exotoxin	528
Food Poisoning by <i>Clostridium perfringens</i> and <i>Bacillus cereus</i>	528
Botulism Is the Most Feared Type of Food Poisoning Because It Can Result in Paralysis and Death	528
Poisoning by Moldlike Fungi Can Originate from Spoiled Grain and Other Foods	530
Viral Infections of the Lower Alimentary System	530
Various Viruses Infect the Liver, Causing Acute and Chronic Disease	530
A Number of Viruses Cause Vomiting and Diarrhea (Gastroenteritis)	535
Protozoan Diseases of the Lower Alimentary System	536
Giardiasis Is a Common Widespread Disease of the Small Intestine	536
Amebiasis Is a Disease of the Large Intestine Caused by <i>Entamoeba histolytica</i>	538
Review Questions	541
Summary	541
Critical Thinking Questions	542
Further Reading	542

24 Genitourinary Infections 543

Key Concepts 543

A Glimpse of History 544

Introduction 544

Anatomy and Physiology of the Genitourinary System 544

The Urinary Tract Is Generally Well Protected from Infection 544

The Female Genital Tract Is More Often Involved in Infection than Is the Male Genital Tract 545

Normal Flora of the Genitourinary Tract 545

Urinary Tract Infections 545

Bladder Infections in Women are Sometimes Related to Sexual Intercourse 546

Kidney Infections May Follow Infections of the Bladder 546

Perspective 24.1: Urine Specimens Are Used to Diagnose Urinary Infections 547

Bladder Infections Usually Originate from the Normal Intestinal Flora 547

Microorganisms from Disseminated Disease Can Be Excreted in Urine 547

Genital Tract Infections 548

Perspective 24.2: Symptoms Suggestive of a Sexually Transmitted Disease 549

Sexually Transmitted Diseases: Bacterial 549

Gonorrhea Leads the List of Reportable Bacterial Diseases in the United States 549

Perspective 24.3: Plasmid-mediated Antibiotic Resistance of *Neisseria gonorrhoeae* 551

Chlamydial Infections Rival Gonorrhea in Frequency 553

Syphilis is the "Great Imitator" of Other Diseases 554

Perspective 24.4: Laboratory Diagnosis of Syphilis 556

Chancroid Is Characterized by Painful Genital Ulcers 559

Review Questions 559

Sexually Transmitted Diseases: Viral 559

Genital Herpes Simplex Is Characterized by Small, Painful Genital Blisters and Ulcers 559

Some Papillomaviruses Cause Genital Warts and Others Probably Contribute to Cervical Cancer 560

AIDS Is a Late Manifestation of Human Immunodeficiency Virus Infection 561

Perspective 24.5: HIV Infection on College Campuses 562

Other Genital Tract Infections 562

Bacterial Vaginosis Is Characterized by an Unpleasant Odor and Large Numbers of *Gardnerella vaginalis* 562

Vulvovaginal Candidiasis Often Results from Antibacterial Therapy 563

Perspective 24.6: Laboratory Diagnosis of *Candida albicans* 564

The Protozoan *Trichomonas vaginalis* Can Cause Urogenital Infections in Men and Women 564

Perspective 24.7: Laboratory Diagnosis of *Trichomonas vaginalis* 565

Puerperal Fever Is Now Rare Because of Aseptic Birthing Practices and Antibiotics 566

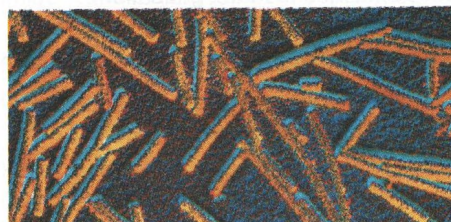

Toxic Shock Syndrome Is Often Caused by Certain Strains of *S. aureus* Growing in the Vagina 566

Review Questions 567

Summary 567

Critical Thinking Questions 568

Further Reading 569

25 Nervous System Infections 570

Key Concepts 570

A Glimpse of History 571

Introduction 571

Anatomy and Physiology of the Central Nervous System 571

Infections Generally Enter the Central Nervous System from the Blood, the Skull Bones, or via the Nerves 572

Normal Flora 572

Bacterial Infections of the Nervous System 573

Meningococcal Meningitis Can Be Rapidly Fatal 573

Perspective 25.1: Laboratory Diagnosis of Meningococcal Disease 575

Numerous Other Species of Bacteria Can Cause Meningitis 576

Leprosy Is Caused by *Mycobacterium leprae*, an Acid-fast, Slow Growing Rod that Has Not Been Cultivated *in Vitro* 577

Perspective 25.2: Laboratory Diagnosis of Leprosy 579

Review Questions 580

Viral Diseases of the Nervous System 580

Perspective 25.3: Arthropod-borne Encephalitis Epidemic, Florida 1990 581

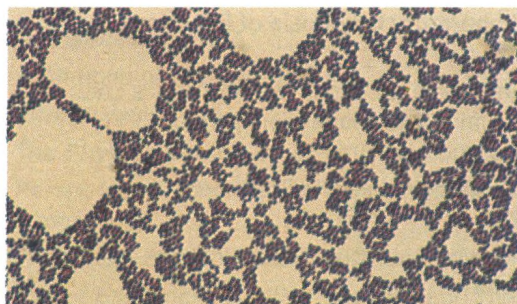

Cases of Sporadic Encephalitis Occur Widely Scattered in Time and Place 581

- Epidemic Encephalitis Generally Results from the Spread of Arboviruses to Humans 581
- Poliomyelitis (Infantile Paralysis) Is Caused by Poliovirus Infection of the Motor Nerves 581
- Perspective 25.4: Laboratory Diagnosis of Poliomyelitis 583**
- Perspective 25.5: Human Rabies, Texas 1990 584**
- Rabies Has a Long Incubation Period and Is Generally Fatal 584
- Perspective 25.6: Laboratory Diagnosis of Rabies 585**
- Fungal Diseases of the Central Nervous System 587**
- Cryptococcal Meningoencephalitis Is Caused by the Yeast Form of the Fungus *Filobasidiella neoformans* 587
- Perspective 25.7: Laboratory Diagnosis of Cryptococcal Meningoencephalitis 588**
- Protozoan Diseases of the Central Nervous System 589**
- African Sleeping Sickness Is Acquired from the Bite of a Tsetse Fly 589
- Perspective 25.8: Laboratory Diagnosis of African Sleeping Sickness 590**
- Perspective 25.9: Spongiform Encephalopathies 591**
- Review Questions 591
- Summary 592
- Critical Thinking Questions 593

26 Wound Infections 594

- Key Concepts 594
- A Glimpse of History 594
- Introduction 595
- Features of Wounds 595
- Wound Abscesses Are Difficult to Cure Using Antimicrobial Medicines Alone 595
- Anaerobic Conditions Are Present in Many Wounds 596
- Bacterial Infections of Wounds 597**
- Staphylococcus aureus* Causes Most Surgical Wound Infections 597
- Pseudomonas aeruginosa* Infections Contribute to Deaths Among Burn Patients 599
- Tetanus Has a High Mortality but Is Easily Prevented by Immunization 600
- Review Questions 602
- Gas Gangrene Is a Complication of Neglected, Dirty Wounds 602
- Perspective 26.1: Laboratory Diagnosis of Gas Gangrene 604**
- Other Anaerobic Bacteria Can Cause Wound Infection 605
- A Variety of Bacterial Infections Can Result from Animal and Human Bites 606
- Perspective 26.2: Infection Caused by a Human "Bite" 607**
- Fungal Infections of Wounds 607**
- Sporotrichosis Is a Chronic Fungal Disease of People Whose Work Exposes Them to Splinters and Thorns 607

- Perspective 26.3: Laboratory Diagnosis of Sporotrichosis 608**
- Review Questions 608
- Perspective 26.4: An Epidemic of Sporotrichosis in the United States 609**
- Summary 609
- Critical Thinking Questions 610
- Further Reading 610

27 Blood and Lymphatic Infections: Bacterial 611

- Key Concepts 611
- A Glimpse of History 612
- Introduction 612
- Anatomy and Physiology 612
- Normal Flora 614
- Bacterial Diseases of the Blood Vascular System 614**
- Subacute Bacterial Endocarditis Involves the Valves and Lining of the Heart Chambers 614
- Acute Bacterial Endocarditis Is Caused by More Virulent Bacteria than Those that Cause SBE 615
- The Seriousness of Gram-negative Septicemia Relates to Endotoxin 615
- Perspective 27.1: Endotoxin Contamination of Cardiac Catheters 616**
- Perspective 27.2: Laboratory Diagnosis of Gram-negative Septicemia 617**
- Review Questions 617
- Bacterial Diseases Involving the Lymph Nodes and Spleen 618**
- Tularemia Is a Dangerous Zoonosis Caused by an Unusual Gram-negative Rod 618
- Brucellosis Is a Zoonosis Acquired from Domestic Animals 618
- Perspective 27.3: Laboratory Diagnosis of Tularemia 619**
- Plague, Once Pandemic, Persists Endemically in Many Parts of the World 620
- Review Questions 622
- Summary 622
- Critical Thinking Questions 622
- Further Reading 622

28 Blood and Lymphatic Infections: Viral and Protozoan 623

Key Concepts 623

A Glimpse of History 624

Introduction 624

Viral Diseases of the Lymphoid System 624

Infectious Mononucleosis Is Followed by a Latent Infection of B Lymphocytes 624

Perspective 28.1: Laboratory Diagnosis of Infectious Mononucleosis 625

The Acquired Immunodeficiency Syndrome (AIDS) Is a Late Manifestation of Human Immunodeficiency Virus (HIV) Infection 627

Perspective 28.2: Surgeon General's Statement on AIDS, 1986* 628

Perspective 28.3: Nonintimate Contact Is Unlikely to Transmit AIDS 631

Perspective 28.4: Some Infectious Diseases that Complicate AIDS 634

Review Questions 638

Yellow Fever Persists as a Zoonosis in Jungles 638

Protozoan Infections 639

Malaria Is Showing Resurgence in Many Countries of the World 639

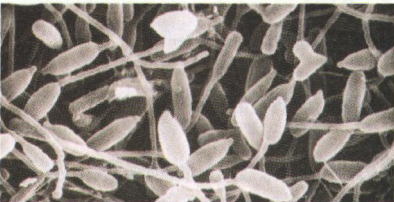

Perspective 28.5: Transplacental Transmission of Malaria by an Asymptomatic Mother 641

Review Questions 642

Summary 643

Critical Thinking Questions 643

Further Reading 643

29 Antimicrobial and Antiviral Medicines 644

Key Concepts 644

A Glimpse of History 645

Introduction 645

Antibiotics—An Overview 645

Perspective 29.1: A Red Dye and Good Luck Produce a Breakthrough 646

Antibacterial Medicines 647

The Synthetic Antibacterial Medicines Include Sulfa Drugs, Trimethoprim, Isoniazide, and Others 647

Perspective 29.2: A Near-fatal Human Infection Is Cured with Prontosil 648

The Antibacterial Antibiotics Include Penicillins, Cephalosporins, Tetracyclines, Aminoglycosides, and Others 648

Modes of Action of Antimicrobial Medicines 653

Competitive Inhibition Involves Reversible Impairment of an Enzyme by a Substance Resembling the Enzyme's Normal Substrate 653

Some Antibiotics Impair Cell Wall Synthesis 653

Inhibition of Protein Synthesis Depends on Differences Between Eukaryotic and Prokaryotic Ribosomes 653

A Few Antibacterial Medicines Are Active Against Cytoplasmic Membranes 653

Some Antimicrobials Inhibit Nucleic Acid Synthesis 654

Review Questions 654

Bacterial Sensitivity Testing 655

Susceptibility Can Be Quantified by Determining Minimal Inhibitory Concentrations 655

The Terms Sensitive and Resistant Refer to Whether a Microorganism Is Likely to Be Treatable or Not 655

Perspective 29.3: Measuring the Amounts of Antimicrobial Agents in Body Fluids 656

Limitations on the Value of Antimicrobial Agents 657

The Percentage of Resistant Strains Has Progressively Increased Following the Introduction of Each New Antibacterial Medicine 657

Perspective 29.4: Distinguishing Sensitive and Resistant Organisms by Using Dry Paper Antimicrobial-containing Disks 658

Perspective 29.5: Antibiotics in the Food of Domestic Animals 660

Toxins and Host Factors May Also Limit Antimicrobial Effectiveness 660

Medicines Useful Against Eukaryotic Pathogens 660

Antifungal Medicines Usually Have a Very Low Therapeutic Ratio 660

Medicines Active Against Protozoa Also Have a Low Therapeutic Ratio 662

Antiviral Medicines 662

Amantadine Helps Prevent Influenza A in Nonimmune Individuals 663

Many Antiviral Medications Are Structurally Similar to the Purines and Pyrimidines of DNA and RNA 664

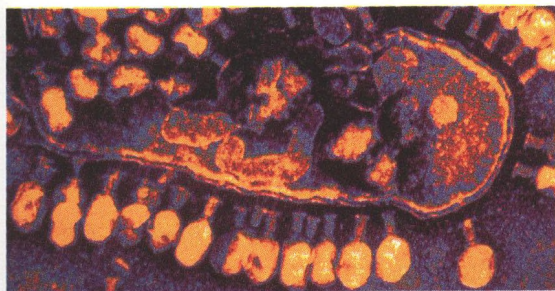

Interferons Are Antiviral Substances that Are Produced by Human Cells 664

Review Questions 665

Summary 665

Critical Thinking Questions 666

PART 4

Applied Microbiology 667

30 Microbial Ecology and Terrestrial Microbiology 668

Key Concepts 668

A Glimpse of History 669

Introduction 669

The Principles of Microbial Ecology 669

Microbial Competition Demands Rapid Reproduction and Efficient Nutrient Use 670

Microbial Populations Both Cause and Adapt to Environmental Changes 671

Some Bacteria Can Grow in a Low-nutrient Environment 672

Microorganisms and Soil 672

Soil Is a Complex Substance Composed of Both Organic and Inorganic Materials 673

Soil Teems with a Variety of Life Forms 673

Environmental Influences on the Bacterial and Fungal Flora in Soil 674

Moisture in the Soil Affects the Oxygen Supply 674

Acidity Influences the Relative Proportion of Fungi 675

Temperature Regulates Microbial Activities 675

Organic Matter Limits the Size of the Microbial Population 675

Review Questions 675

Biochemical Cycling 675

Oxygen Cycles Between Respirers and Photosynthesizers 677

Carbon Cycles Between Organic Compounds and Carbon Dioxide 677

Nitrogen Cycles Between Organic Compounds and a Variety of Inorganic Compounds 678

Perspective 30.1: How Roots Are Infected with Rhizobium 681

Phosphorus Also Cycles Between Organic and Inorganic Forms 682

The Sulfur Cycle Involves Several Important Types of Organisms 682

Microbial Decomposition of Synthetic Chemicals 683

Review Questions 685

Summary 685

Critical Thinking Questions 686

33 The Microbiology of Food and Beverages 717

Key Concepts	717
A Glimpse of History	718
Introduction	718
Food Spoilage	718
Microorganisms Are Responsible for Food Spoilage	718
The Specific Condition of the Food Will Determine Which Organisms Will Grow	720
Some Foods Are Protected by Naturally Occurring Antimicrobial Substances	720
Review Questions	721
Food Preservation	722
Microbial Food Contaminants Can Sometimes Be Killed by High-temperature Treatment Without Harming Food Quality	722
Growth of Spoilage Organisms Is Slowed or Halted by Low-temperature Treatment	724
Desiccation (Drying) Prevents Microbial Growth by Reducing the Water Activity	724
Chemicals Can Be Added to Foods as Preservatives	725
Irradiation Can Be Used for Food Preservation	725
Perspective 33.1: Salmonella in Milk	726
The United States Has Strict Standards of Control of Microbial Hazards in Food	726
Food-borne Illnesses Can Occur in Spite of Governmental Controls	726

Review Questions	727
Microbes and the Production of Foods and Beverages	727
Some Foods Produced from Milk Are Made Using Lactic Acid Bacteria	727
Pickled Foods Are Also Made Using Lactic Acid Bacteria	730
Soy Sauce Is Traditionally Made by Fermentation	730
Yeasts Are Important in the Production of Many Breads	730
Alcoholic Beverages Are Produced by Yeast Under Anaerobic Conditions	731
