

The American Journal of Pathology

Official Journal of the American Society for Investigative Pathology

January 2010 • Volume 176, Number 1

On the Cover: During nephrogenesis, FoxD1-positive mesenchymal cells give rise to adult CD73⁺, PDGFR β ⁺, SMA⁻ interstitial pericytes, and these FoxD1-derivative interstitial cells expand and differentiate into SMA⁺ myofibroblasts during fibrosis. This process was examined using unilateral ureteral obstruction in Six2-GC+;Z/Red mice, which exhibit severe tubule injury fibrosis and disruption of basement membranes. Shown is immunodetection of laminin (red) and lotus lectin binding (green) to detect proximal tubules in healthy kidney of untreated mice.
