On the Cover

The featured cover illustration depicts the anatomical relationships relevant to MRI-guided laser interstitial thermal therapy (LITT) for the ablation of a hypothalamic hamartoma. The right frontal view shows the laser catheter trajectory through the basal ganglia and internal capsule and under the

arch of the fornix into the hamartoma, which is bounded by the hypothalamus and the optic tracts. Disconnection of the hypothalamic hamartoma, a pathological structure, can cure patients of gelastic seizures. Balancing the risk posed to each of these boundary structures is vital for obtaining favorable results. Read more on p. 1183. © Barrow Neurological Institute, Phoenix, Arizona.
