1	How Should Living Systems Be Studied?	1
1.1	What Is Life?	1
1.2	A Half Century of Molecular Biology	3
1.3	The Reemergence of <i>Diversity</i> and the Enumerative “-ome” Doctrine	7
1.4	Diversity and Dependence on Environmental Circumstances ..	10
1.5	Systems of Strongly Interacting Elements	13
1.6	Are Living Organisms “Computing Machines”?	15
1.7	Problems with the “Program” Point of View	18
1.8	The Problem of Stability	20
1.9	Systems Evolving Amongst Fluctuations	22
1.10	Spontaneity	24
1.11	How the Parts Composing the Whole Are Determined by the Whole	27
1.12	Universal Properties That Cannot Be Traced Back to Molecules	28
1.13	Transcending Enumeration	31
1.13.1	The Absolute Limitation of Enumeration	32
1.13.2	Standard for Enumeration	32
1.13.3	The Essence of Life Does Not Lie in Combinatorial Complexity	32
1.13.4	The Importance of Fluctuations	33
1.13.5	The Essential Difficulty Involved in Constructing That Precisely Describe Biological Phenomena	34
1.13.6	The Lack of Reliable Fundamental Equations	34
1.13.7	A Description of Phenomena is Not Equivalent to an Understanding	35
1.13.8	The Necessity for a New Framework	35

2	Constructive Biology	37
2.1	The Understanding Obtained Through Construction	37
2.2	The "Way" of Construction	39
2.3	Examples of Studies in Constructive Biology	40
2.4	On the Mode of Understanding	44
2.4.1	Remark: Synthetic Biology	45
2.4.2	Remark: Artificial Life	46
3	Basic Concepts in Dynamical Systems	47
3.1	Basic Picture in Dynamical Systems	47
3.1.1	Representation of a Cell Ensemble by the Distribution of Points in the State Space	50
3.2	The Role of Fluctuations	57
3.2.1	Fluctuations and Stability	57
3.2.2	The Relation Between Response and Fluctuations – the Fluctuation-Response Relation	59
3.2.3	Fluctuations Are Not due Entirely to Noise from the Environment But Result also from Internal Dynamics and Depend on the Internal State	62
3.3	Plasticity	63
3.4	Representation of "Softness"	66
3.5	Coupled Dynamical Systems for the Study of Cell System	71
3.6	Chaotic Itinerancy	74
3.6.1	Relevance to Biological System	77
3.6.2	Experimental Method in Studying Itinerancy	79
4	Origin of Bioinformation	81
4.1	Question to Be Addressed	81
4.2	Logic: Minority Control Hypothesis	89
4.3	Toy Model	91
4.4	Result	94
4.5	Minority-Controlled State	97
4.5.1	Preservation of Minority Molecule	97
4.5.2	Control of the Growth Speed	97
4.5.3	Control of Chemical Composition by the Minority Molecule	98
4.5.4	Evolvability	99
4.6	Experiment	100
4.7	Relevance to Biology	105
4.7.1	Heredity from a Kinetic Viewpoint	105
4.7.2	Accessibility to MCS	107
4.7.3	Closing Remark	108

5	Origin of a Cell with Recursive Growth	111
5.1	Question to Be Addressed	111
5.2	Logic	112
5.3	Model.....	114
5.3.1	Modeling Strategy for the Chemical Reaction Networks	114
5.3.2	Specific Model	117
5.4	Result	118
5.4.1	Dependence of Phases on the Basic Parameters	120
5.4.2	Maintenance of Recursive Production	122
5.4.3	Switching	125
5.4.4	Fluctuations	125
5.5	Experiment	127
5.5.1	Replicating Liposome	127
5.5.2	Protein Synthesis within a Liposome	128
5.5.3	For the Synthesis of Artificial Replicating Cell	131
5.6	Relevance to Biology	132
6	Universal Statistics of a Cell with Recursive Growth	135
6.1	Question to Be Addressed	135
6.2	Logic	137
6.3	Model.....	139
6.4	Result	140
6.4.1	Log-Normal Distribution	145
6.5	Experiment	148
6.5.1	Confirmation of Zipf's Law	148
6.5.2	Confirmation of Laws on Fluctuations.....	150
6.6	Relevance to Biology	152
6.6.1	Cluster Analysis of Gene Expression	152
6.6.2	Remark on Universal Log-Normal Statistics.....	153
6.6.3	Relationship Between Abundance Statistics and Network Topology	154
7	Cell Differentiation and Development	159
7.1	Question to Be Addressed: Stability of Development	159
7.1.1	Kauffman's Gene Network Model.....	164
7.2	Logic: Isologous Diversification	167
7.3	Model.....	170
7.3.1	Internal Biochemical Reaction Network	171
7.3.2	Interaction Among the Cells	171
7.3.3	Cell Division.....	173
7.3.4	Molecular Fluctuation	173
7.3.5	Model Equation	174
7.4	Results.....	174
7.4.1	Five Stages of Isologous Diversification	174

7.5	Further Results on Robustness and Dynamics of Differentiation	180
7.5.1	Robustness of Developmental Process	180
7.5.2	Transplant Experiment and Cellular Memory	182
7.5.3	Separation of Inherent Time Scales	183
7.5.4	Relevance of Low-Concentration Chemical to the Initiation of Differentiation	183
7.6	Experiment	184
7.6.1	Differentiation of <i>E. coli</i> Through Interaction	184
7.6.2	Interaction-Dependent Tumor Genesis	187
7.7	Relevance to Biology	187
7.7.1	Summary of the Result	187
7.7.2	Robustness from Unstable Dynamics	188
7.7.3	Relevance of Molecules with Very Low Concentration to Development	189
7.7.4	Oscillation	189
7.7.5	Control of Tumor Formation	189
7.8	Appendix: An Example of Model Equation	190
8	Irreversible Differentiation from Stem Cell and Robust Development	193
8.1	Question to Be Addressed: Regulation for Differentiation of Stem Cell	193
8.2	Logic: Chaotic Stem Cell	198
8.2.1	Direction of Determination: Logic	200
8.3	Model	201
8.4	Results	202
8.4.1	Hierarchical Differentiation	202
8.4.2	Dual Coding of Cellular State: Discrete Types and Continuous Modulation of Each Type	205
8.4.3	Regulation of Stochastic Differentiation	206
8.4.4	Differentiation of Colony	207
8.4.5	Stability	209
8.4.6	Irreversibility	211
8.4.7	Universality of Differentiation	216
8.5	Experiment	218
8.5.1	Constructive Experiment from Embryonic Stem Cell ...	218
8.5.2	Differentiation from Callus of Plant	219
8.5.3	Construction of "Stem-type Cell" from Bacteria	219
8.6	Relevance to Biology	222
9	Pattern Formation and Origin of Positional Information ...	227
9.1	Question to Be Addressed: Origin of Positional Information ...	227
9.2	Logic	232
9.3	Model	232

9.4	Results	233
9.4.1	Generation of Positional Information	235
9.4.2	Complementary Relationship between Internal Cell State and Positional Information	238
9.4.3	Regeneration Process	238
9.4.4	Importance of the Ordering in Development	240
9.5	Experiment	241
9.6	Relevance to Biology	243
9.6.1	Summary	243
9.6.2	Community Effect	244
9.6.3	Induction and Plasticity	246
9.6.4	Transformation of State Differentiation into Spatial Pattern	246
9.6.5	Destabilization of Intracellular State and Regain of Plasticity: An Interpretation of Gastrulation	247
9.6.6	Origin of Individuality	248
9.7	Appendix: Model for Recursive Growth of Multicellular Organism	251
10	Genetic Evolution with Phenotypic Fluctuations	255
10.1	Question to Be Addressed	255
10.2	Logic	258
10.3	Model and Result of the Simulation	263
10.4	Experiment	266
10.5	Relevance to Biology	271
10.5.1	Phenotype-Genotype Relationship at the Fluctuation Level	271
10.5.2	Confirmation of the Relationship by the Model Presented in Sect. 10.3	275
10.5.3	Biological Significance	277
11	Speciation as a Fixation of Phenotypic Differentiation	281
11.1	Question to Be Addressed	281
11.2	Logic: Interaction-Based Speciation	286
11.3	Model	288
11.3.1	Basic Strategy	288
11.4	Result	290
11.4.1	Process for Genetic Diversification	290
11.5	Further Remarks on the Differentiation Scenario	294
11.5.1	Condition for Genetic Diversification	294
11.5.2	Coevolution of Differentiated Groups	296
11.5.3	Robust Speciation	296
11.5.4	Deterministic Nature of Evolutionary Process	297
11.5.5	Speciation: Reproductive Isolation Under Sexual Recombination	297

11.5.6	Evolution of Mating Preference ²	298
11.5.7	Formation of Allele–Allele Correlation	301
11.5.8	Allopatric Speciation as a Result of Sympatric Speciation	302
11.6	Constructive Experiment	304
11.7	Relevance to Biology	308
11.7.1	Tempo in the Evolution	308
11.7.2	Decrease in the Phenotypic Plasticity	309
11.7.3	Relevance of Developmental Plasticity to Speciation ...	309
11.7.4	Unified Theory for Speciation in Sexual and Asexual (and Unicellular) Organisms.....	310
11.7.5	Adaptive Radiation	311
11.7.6	On the Interaction.....	311
11.7.7	Allopatric Speciation	312
11.7.8	Baldwin's Effect.....	312
11.7.9	Reversing the Order	313
12	Conclusion	315
12.1	Summary	315
12.1.1	Isologous Diversification – General Tendency Toward Differentiation from Identical Units Through Interaction	316
12.1.2	Dynamic Consolidation – a Process Through which Plastic Differentiation is Fixed at a Separate Level with the Aid of Dynamic Interference Among Processes	317
12.1.3	Itinerancy – Long-Term Change of Several Quasi-Steady States with Self-Organized Transition Rules	319
12.1.4	Minority Control – the Tendency for Replicators with Minority Populations to Control the Behavior of the System	320
12.1.5	The Universal Properties of Reproductive Systems.....	321
12.2	Machine Versus Life Revisited.....	322
12.3	Fluctuations, Response, and Stability	324
12.4	The “Law” of Decreasing Plasticity in a Closed System.....	331
12.5	The Restoration of Plasticity in an “Open” System	332
12.6	A Theoretical Approach to Plasticity Dynamics	336
12.7	Developmental Phenomenology: Stability, Irreversibility, Operations, Equation of State.....	341
12.8	Toward an Understanding of the Dynamics of Cognition and Human Society	345
