

Contents

1. PLANCK'S RADIATION LAW AND THE EINSTEIN COEFFICIENTS	1
Maxwell's equations	1
Density of field modes in a cavity	4
Quantization of the field energy	6
Planck's law	9
Einstein's A and B coefficients	12
The case of thermal equilibrium	14
Fluctuations in photon number	16
Restriction to high frequencies	19
2. THEORY OF SIMPLE OPTICAL PROCESSES	22
Macroscopic theory of absorption	22
Properties of the microscopic processes	24
Optical excitation of atoms	27
Microscopic theory of absorption	29
Population inversion: the laser	33
Radiation pressure	37
3. QUANTUM THEORY OF THE EINSTEIN B COEFFICIENT	39
Time-dependent quantum mechanics	39
Form of the interaction Hamiltonian	42
The transition rate	44
Expression for the B coefficient	51
The Dirac delta-function	53
4. THE FREQUENCY-DEPENDENT SUSCEPTIBILITY	56
Definition of the susceptibility	56
Classical theory of the susceptibility	58

x *Contents*

The flow of energy	61
Kramers–Kronig relations	64
Sum rules	68
Quantum theory of the susceptibility	70
Inclusion of damping in the quantum theory	73
Oscillator strengths	77
✓ 5. THEORY OF CHAOTIC LIGHT AND COHERENCE	81
Doppler broadening	82
Collision broadening	84
Composite emission lineshape	88
Time dependence of a chaotic light beam	90
Intensity fluctuations of chaotic light	95
Young's interference fringes	100
Evaluation of the first-order correlation function	102
Fringe intensity and first-order coherence	107
Intensity interference and higher-order coherence	111
✓ 6. QUANTIZATION OF THE RADIATION FIELD	120
Potential theory for the classical electromagnetic field	121
The Coulomb gauge	123
The free classical field	126
The quantum-mechanical harmonic oscillator	128
Quantization of the field	133
The zero-point energy	137
✓ 7. STATES OF THE QUANTIZED RADIATION FIELD	139
The photon phase operator	140
States of well-defined photon phase	143
Physical properties of the single-mode number states	145
Physical properties of the single-mode phase states	146
The coherent photon states	148
Physical properties of the single-mode coherent states	150
The density operator	154
Density operators for pure states	157
Statistical mixture states of the radiation field	159

8. INTERACTION OF THE RADIATION FIELD WITH AN ATOM	164
Classical Hamiltonian for coupled fields and charges	164
Multipole expansion of the Hamiltonian	168
The electric-dipole approximation	171
Second quantization of the atomic Hamiltonian	174
Calculation of photon absorption and emission rates	177
Transformation to the Schrödinger representation	181
Diagonalization of the atom-radiation Hamiltonian	184
Radiative linewidth and frequency shift	191
Frequency-dependent susceptibility for multilevel atoms	195
9. PHOTON OPTICS	199
The photoelectric effect	199
Measurement of the photon intensity	203
Photon coherence properties	207
Higher-order photon coherence	210
Photon counting	214
Photon distributions for coherent and chaotic light	217
Quantum-mechanical photon-count distribution	221
Photon experiments	225
10. THEORY OF THE LASER	232
Photon rate-equations	232
Time dependence of the photon coherence	236
Laser threshold condition	241
Rate equations for the atoms	244
Rate equations for the laser photons	248
The laser photon distribution	251
Fluctuations in laser light	258
Laser phase-diffusion rate	261
Appendix to Chapter 10	264
11. THE SCATTERING OF LIGHT BY ATOMS	267
The scattering cross-section	267
Classical theory of elastic scattering	271

General expression for radiative transition rates	275
Time-dependent perturbation theory	278
The Kramers–Heisenberg formula	281
Elastic scattering	285
Inelastic scattering: the Raman effect	290
12. NON-LINEAR OPTICS	297
Two-photon absorption (two beams)	298
Two-photon absorption (single beam)	304
The non-linear susceptibility	307
The stimulated Raman effect	312
Third-harmonic generation	318
Photon statistical properties and non-linear optics	323
INDEX	331
