

## Introduction

		vii
<b>1. Magnetic clusters</b>		<b>1</b>
1.1. Dimers		1
1.1.1. <i>Spin gap in cesium divanadate</i>		3
1.1.2. <i>Mineral urusovite</i>		4
1.1.3. <i>Copper trifluoroacetate</i>		9
1.2. Trimers		15
1.2.1. <i>Trimers of octahedra in rubidium-copper diphosphate</i>		18
1.2.2. <i>Trimer plaquettes in sodium-copper germanate</i>		24
1.3. Tetramers		28
1.4. Bose-Einstein condensation of magnons		33
1.4.1. <i>Pigment of the Han Dynasty</i>		34
1.4.2. <i>Barium-vanadium disilicate</i>		35
<b>2. Quasi-one dimensional magnetics</b>		<b>42</b>
2.1. Homogeneous chain of half-integer spins		42
2.1.1. <i>Rubidium-copper molybdate</i>		44
2.1.2. <i>Vanadyl diacetate</i>		45
2.2. A homogeneous chain with competing interactions		54
2.2.1. <i>Lithium-copper zirconate</i>		56
2.2.2. <i>Isostructural cuprates of lithium and sodium</i>		58
2.2.3. <i>Rubidium-copper-aluminium phosphate</i>		66
2.2.4. <i>Cesium-copper vanadium-diphosphate</i>		72
2.2.5. <i>Bismuth-iron selenite-oxochloride</i>		78
2.3. Alternating chain of half-integer spins		83
2.4. A homogeneous chain of integer spins		88
2.5. Spin-Peierls transition		97
2.6. Orbital mechanism of dimerization of the spin chain		101
<b>3. Spin ladders</b>		<b>106</b>
3.1. Spin ladders with an odd number of legs:		106
3.2. Spin ladders with an even number of legs: a spin liquid with an energy gap in the spectrum of magnetic excitations		108
3.3. Charge mechanism of dimerization of the spin ladder		112

## Contents

3.4.	Combinations of spin chains and spin ladders	115
3.5.	Frame structures	117
<b>4.</b>	<b>Quasi-two dimensional magnets with a square lattice</b>	<b>124</b>
4.1.	Quantum ground state	124
4.2.	The Berezinsky–Kosterlitz–Thouless transition	126
4.3.	Manganese chromate	129
5.	Quasi-two dimensional magnetics with a triangular lattice	138
5.1.	Geometrical frustration	138
5.1.1.	Lithium–nickel tellurate	142
5.1.2.	Barium–cobalt antimonide	147
5.1.3.	Delafossites	149
5.2.	BKT transition in two-dimensional magnetic materials with a triangular lattice	151
5.2.1.	Chiral and non-chiral polymorphs of manganese antimonate	153
5.2.2.	Lithium–iron antimonate	167
<b>6.</b>	<b>Quasi-two dimensional magnets with a honeycomb magnetic lattice</b>	<b>178</b>
6.1.	Frustration due to the competition of exchange interactions	178
6.2.	Kitaev model	181
6.3.	Experimental realization of Kitaev’s model	182
6.4.	BKT transition in the honeycomb lattice	190
6.5.	Antimonates and tellurates of transition metals	192
6.5.1.	Nickel antimonates	201
6.5.2.	Cobalt antimonates	211
<b>7.</b>	<b>Quasi-two-dimensional magnets with triangular motifs in the structure</b>	<b>219</b>
7.1.	Frustration of exchange interactions in the lattice of kagome and in diamond chains	219
7.1.1.	Herbertsmithite and vésigniéite	221
7.1.2.	The combination of kagome and triangular layers in quasi-2D cobaltites	223
7.1.3.	Langasites	237
7.1.4.	Dugganites	248
7.2.	Plateau of magnetization in the lattice of diamond chains	257
7.3.	Shastry–Sutherland lattice	266
7.4.	Potassium carbonate–manganese vanadate	270
7.5.	Sodium–nickel phosphate hydroxide	275
	<b>Conclusion</b>	<b>283</b>
	<b>References</b>	<b>285</b>
