Series Editor's Foreword	vii
Preface	xi
1 Axioms, congruence, area and Pythagoras	1
1.1 From Descartes to Euclid	1
1.2 From Euclid to Hilbert	2
1.3 Ruler and compass constructions	8
1.4 The SAS congruence axiom	11
1.5 The SSS congruence theorem	15
1.6 The ASA congruence theorem	17
1.7 Proof that parallel lines exist and that angles in a triangle add to 180°	18
1.8 Area	23
1.9 The theorem of Pythagoras	25
1.10 Additional problems	26
2 Similar triangles and trigonometry	31
2.1 Similarity and proportion: angles and lengths	31
2.2 From Pythagoras to Eudoxus	33
2.3 The basic results about similarity	38
2.4 Worked examples	43
2.5 Elementary trigonometry	48
2.6 Sine and cosine rules	57
2.7 Apollonius's theorem	60

3	Circles	63
3.1	Elementary circle theorems	63
3.2	Tangency theorems	72
3.3	Ptolemy's theorem	77
3.4	The centres of similitude of two circles	79
3.5	A triangle and its medial triangle	80
4	Triangles	83
4.1	Notation and revision	83
4.2	The orthocentre	86
4.3	The nine-point circle and Euler line	90
4.4	The incircle and excircles	91
4.5	Relationships involving radii	95
4.6	The Simson line	99
5	Areal coordinates, Ceva and Menelaus	101
5.1	Vector treatment of a line	102
5.2	Vector treatment of the plane of a triangle	103
5.3	Areas using vectors and areal coordinates.	105
5.4	Ceva's theorem	110
5.5	Menelaus's theorem	114
5.6	Desargues' theorem	116
5.7	The symmedian point	117
6	Geometrical inequalities	121
6.1	Different versions of the same inequality	121
6.2	The AM-GM and other inequalities	124
6.3	Squares of distances, geodesics and the Fermat point	129
7	Other geometrical techniques	137
7.1	Vectors	137
7.2	Rectangular Cartesian coordinates	139
7.3	Complex numbers	151
7.4	Inversion	157
	Hints and solutions to the exercises	165
	Bibliography	207
	Index	209
