Acknowledgements, x

Preface, xi

Abbreviations, xii

User guide, xvi

1 Innate immunity, 1

External barriers against infection, 1

Phagocytic cells kill microorganisms, 2

Complement facilitates phagocytosis, 10

Complement can mediate an acute inflammatory reaction, 13

Humoral mechanisms provide a second defensive strategy, 16

Extracellular killing, 18

2 Specific acquired immunity, 21

Antibody—the specific adaptor, 21

Cellular basis of antibody production, 23

Acquired memory, 28

Acquired immunity has antigen specificity, 29

Vaccination depends on acquired memory, 30

Cell-mediated immunity protects against intracellular organisms, 31

Immunopathology, 32

3 Antibodies, 37

The division of labor, 37

Five classes of immunoglobulin, 37

The IgG molecule, 38

The structure and function of the immunoglobulin classes, 43

Genetics of antibody diversity and function, 52

4 Membrane receptors for antigen, 61

The B-cell surface receptor for antigen (BCR), 61

The T-cell surface receptor for antigen (TCR), 63

The generation of diversity for antigen recognition, 67
NK receptors, 72
The major histocompatibility complex (MHC), 75

5 The primary interaction with antigen, 86

What antibodies see, 86
Identifying B-cell epitopes on a protein, 89
Thermodynamics of antibody–antigen interactions, 91
Specificity and cross-reactivity of antibodies, 92
What the T-cell sees, 95
Processing of intracellular antigen for presentation by Class I MHC, 95
Processing of antigen for Class II MHC presentation follows a different pathway, 97
Cross-presentation for activation of naive CD8⁺ T-cells, 100
The nature of the ‘groovy’ peptide, 101
The $\alpha\beta$ T-cell receptor forms a ternary complex with MHC and antigenic peptide, 103
T-cells with a different outlook, 105
Superantigens stimulate whole families of lymphocyte receptors, 106
The recognition of different forms of antigen by B- and T-cells is advantageous to the host, 107

6 Immunological methods and applications, 111

Making antibodies to order, 111
Purification of antigens and antibodies by affinity chromatography, 117
Modulation of biological activity by antibodies, 118
Immunodetection of antigen in cells and tissues, 119
Detection and quantitation of antigen by antibody, 125
Epitope mapping, 130
Estimation of antibody, 131
Detection of immune complex formation, 137
Isolation of leukocyte subpopulations, 137
Gene expression analysis, 139
Assessment of functional activity, 140
Genetic engineering of cells, 147

7 The anatomy of the immune response, 155

The need for organized lymphoid tissue, 155
Lymphocytes traffic between lymphoid tissues, 156
Lymph nodes, 160
Spleen, 162
The skin immune system, 162
Mucosal immunity, 163
Bone marrow can be a major site of antibody synthesis, 166
The enjoyment of privileged sites, 167
The handling of antigen, 167

8 Lymphocyte activation, 171

Clustering of membrane receptors leads to their activation, 171
T-lymphocytes and antigen-presenting cells interact through several pairs of accessory molecules, 172
The activation of T-cells requires two signals, 173
Protein tyrosine phosphorylation is an early event in T-cell signaling, 173
Downstream events following TCR signaling, 174

B-cells respond to three different types of antigen, 178
The nature of B-cell activation, 180

9 The production of effectors, 185

Cytokines act as intercellular messengers, 185
Different T-cell subsets can make different cytokine patterns, 191
Activated T-cells proliferate in response to cytokines, 194
T-cell effectors in cell-mediated immunity, 195
Proliferation and maturation of B-cell responses are mediated by cytokines, 200
What is going on in the germinal center?, 200
The synthesis of antibody, 202
Immunoglobulin class switching occurs in individual B-cells, 202
Factors affecting antibody affinity in the immune response, 204
Memory cells, 206

10 Control mechanisms, 211

Antigens can interfere with each other, 211
Complement and antibody also play a role, 211
Activation-induced cell death, 213
T-cell regulation, 213
Idiotype networks, 218
The influence of genetic factors, 220
Regulatory immunoneuroendocrine networks, 223
Effects of diet, exercise, trauma and age on immunity, 226

11 Ontogeny and phylogeny, 229

Hematopoietic stem cells, 229
The thymus provides the environment for T-cell differentiation, 229
T-cell ontogeny, 233
T-cell tolerance, 237
B-cells differentiate in the fetal liver and then in bone marrow, 243
B-1 and B-2 cells represent two distinct populations, 244
Development of B-cell specificity, 245
The induction of tolerance in B-lymphocytes, 247
Natural killer (NK) cell ontogeny, 249
The overall response in the neonate, 250
The evolution of the immune response, 250
The evolution of distinct B- and T-cell lineages was accompanied by the development of separate sites for differentiation, 252
Cellular recognition molecules exploit the immunoglobulin gene superfamily, 252

12 Adversarial strategies during infection, 256

Inflammation revisited, 256
Extracellular bacteria susceptible to killing by phagocytosis and complement, 260
Bacteria which grow in an intracellular habitat, 268
Immunity to viral infection, 272
Immunity to fungi, 277
Immunity to parasitic infections, 278

13 Vaccines, 287

Passively acquired immunity, 287
Vaccination, 290
Killed organisms as vaccines, 290

- Live attenuated organisms have many advantages as vaccines, 291
- Subunit vaccines containing individual protective antigens, 294
- Epitope-specific vaccines may be needed, 297
- Current vaccines, 301
- Vaccines under development, 301
- Vaccines against parasitic diseases have proved particularly difficult to develop, 305
- Vaccines for protection against bioterrorism, 307
- Immunization against cancer, 307
- Other applications for vaccines, 307
- Adjuvants, 307

- 14 Immunodeficiency, 312**
 - Deficiencies of innate immune mechanisms, 312
 - Primary B-cell deficiency, 315
 - Primary T-cell deficiency, 316
 - Combined immunodeficiency, 318
 - Recognition of immunodeficiencies, 320
 - Treatment of primary immunodeficiencies, 320
 - Secondary immunodeficiency, 320
 - Acquired immunodeficiency syndrome (AIDS), 321

- 15 Hypersensitivity, 336**
 - Anaphylactic hypersensitivity (Type I), 336
 - Antibody-dependent cytotoxic hypersensitivity (Type II), 347
 - Immune complex-mediated hypersensitivity (Type III), 350
 - Cell-mediated (delayed-type) hypersensitivity (Type IV), 356
 - Stimulatory hypersensitivity (Type V), 359
 - 'Innate' hypersensitivity reactions, 360

- 16 Transplantation, 364**
 - Genetic control of transplantation antigens, 364
 - Some other consequences of MHC incompatibility, 366
 - Mechanisms of graft rejection, 367
 - The prevention of graft rejection, 369
 - Is xenografting a practical proposition?, 375
 - Stem cell therapy, 376
 - Clinical experience in grafting, 377
 - The fetus is a potential allograft, 380

- 17 Tumor immunology, 384**
 - Cellular transformation and immune surveillance, 384
 - Tumor antigens, 385
 - Spontaneous immune responses to tumors, 389
 - Tumor escape mechanisms, 391
 - Unregulated development gives rise to lymphoproliferative disorders, 392
 - Approaches to cancer immunotherapy, 398
 - Immunodiagnosis of solid tumors, 407

- 18 Autoimmune diseases, 410**
 - The scope of autoimmune diseases, 410
 - Nature and nurture, 413
 - Autoreactivity comes naturally, 420
 - Is autoimmunity driven by antigen?, 422

Control of the T-helper cell is pivotal, 423
Autoimmunity can arise through bypass of T-helpers, 424
Autoimmunity can arise through bypass of regulatory mechanisms, 428
Autoimmune disorders are multifactorial, 431
Pathogenic effects of humoral autoantibody, 432
Pathogenic effects of complexes with autoantigens, 435
T-cell-mediated hypersensitivity as a pathogenic factor in autoimmune disease, 440
Some other systemic vascular disorders with immunopathological components, 444
Diagnostic value of autoantibody tests, 445
Treatment of autoimmune disorders, 445

Appendix: Glossary, 456
