On the Cover

This month's cover shows the beauty and intricacy of the neuron. For this image, researchers Caroline Charlier and Daniel Dunia (CPTP Toulouse, France) infected a primary culture of neurons with Bornavirus, then incubated it with fluorescent tetanus toxin. After fixation of the cultures, the Bornavirus phosphoprotein (green) and β III tubulin (blue; a neuronal marker) can be seen with immunofluorescence analysis. Read more at www.zeiss.com/confocal.
