Properties of Light

| Properties of Light | 127 |
|---------------------------------------------------------------------------------------------------------------------------|-----|
| 12.11 The Conversion of Light Energy to Thermal Energy 12.12 Refraction and Diffraction: The Separation of White Light | 129 |
| into Colors | 131 |
| 12.13 Disappearing Glass: Index of Refraction | 135 |
| 12.14 Disappearing Gel: Index of Refraction | 141 |
| 12.15 Observing the Transmission Spectra of Dyes | 146 |
| 12.16 Dichroism: Transmission versus Reflection | 151 |
| 12.17 Iridescence from a Polymer Film | 154 |
| 12.18 The Photoelectric Effect | 156 |
| 12.19 The Tyndall Effect: Scattered Light Is Polarized | 160 |
| 12.20 Rainbow Spiral in an Optically Active Solution | 163 |
| 12.21 A Sugar Solution Between Polarizers | 160 |
| 12.22 The Diferingence of Calche | 10/ |
| 12.23 A Elquid Crystal Display through a Polarizer 12.24 Laser Light Is Polarized | 175 |
| Perception and Vision | 179 |
| 12.25 Additive Color Mixing | 101 |
| 12.25 Additive Color Mixing | 101 |
| 12.20 Subtractive Filmary Colors | 102 |
| 12.28 The Hermann-Grid Illusion | 196 |
| 12.29 Finding the Blind Spot | 201 |
| 12.30 The Land Effect | 204 |
| 12.31 Saturation of the Retina: Afterimage | 208 |
| 12.32 The Persistence of Vision | 212 |
| 12.33 The Imprecision of Peripheral Vision | 215 |
| 12.34 The Pulfrich Phenomenon: Perception of Motion | 218 |
| Photemission: Fluorescence and Phosphorescence | 221 |
| 12.35 Photoluminescence | 223 |
| 12.36 The Halide Quenching of Quinine Fluorescence | 227 |
| 12.37 Differentiation of Fluorescence and Phosphorescence | 232 |
| 12.38 Phosphorescence Excitation: Energy and Color Relationship | 235 |
| 12.39 Quenching Phosphorescence with Light | 238 |
| 12.40 Quenching Phosphorescence with Thermal Energy | 241 |
| 12.41 The Fluorescence of Molecular Iodine Vapor | 243 |
| Photochemistry | 247 |
| 12.42 The Reversible Photochemical Bleaching of Thionine | 249 |
| 12.43 Photochromic Methylene Blue Solution | 256 |
| 12.44 The Photochemical Reaction of Chlorine and Hydrogen | 260 |
| 12.45 The Effects of Solvents on Spiropyran Photochromism and Equilibria | 261 |
| 12.46 A Copper Oxide Photocell | 274 |
| 12.4/ The Photobleaching of Carotene | 277 |

| 12.48 Making a Cyanotype | 283 | |
|------------------------------------------------------------------------------|-----|--|
| 12.49 An Iron(III)-Oxalate Actinometer | 287 | |
| 12.50 The Photoreduction of Silver Halide | 291 | |
| 12.51 Photochemistry in Nitroprusside-Thiourea Solutions | 293 | |
| 12.52 Photochromism in Ultraviolet-Sensitive Beads | 300 | |
| 12.53 The Photodissociation of Bromine and the Bromination | | |
| of Hydrocarbons | 304 | |

and and started thinking about color in my surroundings. I loved color combinations and mated and started thinking about color in my surroundings. I loved color combinations and mated to know why some combinations are more tarmonious than others. The sky is blue and clouds are while, but sometimes near surset they have different colors. These have green envestand some stay green year round, notably the Cedars of Lebanon. The leaves of other reces changed color and fell off in the fail—only to empress, green, in the spring. Some emons are green, while others are yellow. Watermelons are mostly green on the outside, and col on the inside. Looking in the mirror, I observed my blue eyes. At then, streetlights shed white light, and many stores had large illuminated ages displaying their pass of breaking waves were the same color as clouds. Color was everywhere—and ever changing

satisfied with the explanations by my youtbrui curiosities. However, this understanding led to further questions that directed my scholarly investigations to the properties of hight and its interactions with matter. The contents of this volume reflect some of the fruits of these investigations

Color, light, vision, and perception are the topics of this fifth volume in the series of handbooks samed at providing feathers of science or all educational levels with detailed instructions and background information for using chemical demonstrations in the classmore and in public presentations. This volume deals with serve of agat and consists of one have chapter, with 54 demonstrations and 83 different procedures. The extension introduction to this volume includes material aimed at reinforcing and expanding the background knowledge of the user. I believe firmly that whenever demonstrations are presented, the phenomena should be discussed and explained at a level suitable to the audience. A number of demonstrations, included in this volume involve quite complex chemical concepts. The introductions are informations will enhance the teacher's ability to use the demonstrations effectively. Furthermore, I believe that by sharing fascinating aspects of the physiology of vision and of the psychology of perception, the teacher's ability to use the demonstrations effectively. Furthermore, I believe that by sharing fascinating aspects of the physiology of vision and of the psychology of perception, the teacher can succeed in triggering deeper interest in chemical biology, cognitive science, and neuroscience. I use teachers in chapter, and secondary schools, as well as trachers in colleges and intiversities, to use the material in the introduction to this volume, as well as in the demonstrations, to display intriguing chemical behavior and scientific concepts.

This volume is part of a continuing project whose purposes are to create, collect, develop, test, and publish demonstrations that will help teachers to connect them is a winthe schemic we require the our senses of sight, hearing, smell, teste, and touch. Must classroom and public science demonstrations engage the brain through the eye and the cirbut very few involve offaction, gustation, and touch. These latter topics are the publicate of forthcoming volumes.
