Preface	2
1. Functions of two or more variables	3
1.1. Preliminaries. Euclidean space R^2 as a metric space	3
1.2. The Euclidean space R^2	5
1.3. Metrics on R^2	6
1.4. Functions defined on R^2	7
1.5. Limit of a function in R^2	8
1.6. Continuity of a function	14
1.7. Functions continuous on a compact set	16
1.8. Partial derivatives	18
1.9. Geometric interpretation of partial derivatives	20
1.10. The mean-value theorem for functions of two variables	21
1.11. Differentiable functions and differentials	24
1.12. Necessary conditions for a function to be differentiable	25
1.13. A sufficient condition for a function to be differentiable	27
1.14. Derivatives of composite functions	28
1.15. Directional derivatives	31
1.16. Gradient and its geometric meaning	34
1.17. Tangent plane to a surface	35
1.18. Partial derivatives of higher order	37
1.19. Second directional derivatives	47
1.20. Differentials of higher order. Taylor's theorem	48
1.21. Local extrema for functions of two variables	50
1.22. A necessary condition for local extrema	51
1.23. Stationary points and saddle points	52
1.24. A sufficient condition for local extrema (the second derivative test)	52
1.25. Absolute extrema	56
1.26. Constrained extrema (Lagrange's multipliers)	65
1.27. Implicit functions	69
Problems	75

Answers	81
1.28. Appendix to Chapter 1: Calculus in R^3 (examples)	85
2. Differential equations	96
2.1. Introduction	96
2.2. Equations with separable variables	100
2.3. Equations that can be reduced to separable in variables	104
2.4. Linear differential equations of the first order (variation of a parameter)	107
2.5. Examples of differential equations taken from the world that surrounds us	109
2.5.1. What is the shape of a freely hanging rope	110
2.5.2. The dog-and-rabbit chase	111
2.5.3. Curious trip of a curious beetle	115
2.6. Linear differential equations	116
2.7. A generalized form of the variation of parameters	123
2.8. Linear equations with constant coefficients	126
2.8.8. Appendix: Euler's equation	130
2.9. Finding a particular solution for special right-hand side functions (the method of undetermined coefficients)	131
2.10. The differential equation of an RLC circuit	134
2.11. A word on numerical solutions of differential equations: Euler's method	138
2.12. Systems of linear equations	139
2.13. Homogeneous linear systems	140
2.14. Transforming a system of n linear differential equations to a linear differential equation of the n th order (the elimination method)	141
2.15. Nonhomogeneous systems	143
2.16. Systems of linear equations — the eigenvalue–eigenvector method of solution	149
2.17. An alternative method of finding a fundamental set of solutions (the algorithmic approach)	166
2.18. Nonhomogeneous linear systems with constant coefficients and quasipolynomial right-hand side (the method of undetermined coefficients)	171
2.19. Solving a differential equation by transforming it into a suitable system (the “antielimination”)	175
2.20. Introduction to the notion of stability	177
2.21. Basic concepts of stability (a qualitative analysis)	178
2.22. Stability of autonomous systems (Hurwitz's criterion for linear systems)	181
2.23. Stability in the linear approximation (Liapunov's theorem)	186

Problems	188
Answers	194
3. The Laplace transform	199
3.1. Introduction	199
3.2. The Laplace transform (definition, examples, basic constructions)	199
3.3. Applications of the Laplace transform to differential equations and integro-differential equations	204
3.4. Finding the inverse transform of a rational function	207
3.5. Discontinuous functions and the Laplace transform	211
3.6. Applications of the Laplace transform to partial differential equations	212
3.7. Finding the transform of an impulse	215
3.8. Transforming periodic functions	216
3.9. The Laplace transform of the convolution	218
Problems	220
Answers	223
References and supplementary literature	225
Acknowledgement	226
