

# Contents

<i>Foreword by James Barber FRS</i>	xv
<i>Preface</i>	xix
<b>Chapter 1 How Biology Solved Its Energy Problem and Implications for the Future of Humankind</b>	<b>1</b>
<i>James Barber</i>	
1. Evolution of Bioenergetics	2
1.1. Under anaerobic conditions	2
1.2. Under aerobic conditions	5
2. Water Splitting by Photosystem II	8
3. Efficiency of Aerobic Cellular Bioenergetics	10
4. The Future of <i>Homo sapiens</i>	11
5. Epilogue	22
Acknowledgements	25
References	25
<b>Chapter 2 Theory of Rate Constants of Substeps in Single Molecule Experiments on <math>F_1</math>-ATPase</b>	<b>31</b>
<i>Sándor Volkán-Kacsó and Rudolph A. Marcus</i>	
1. Introduction	32
2. Chemo-Mechanical Coupling, Directionality of Rotation and Role of Single Molecule Experiments	34
2.1. Rate constants and free energy relations	35
2.2. Relevance of single-molecule experiments on the $F_1$ -ATPase deposited on the slide to function in physiological conditions	36
2.3. Directionality of rotation	37
3. Elastic Transfer Theory for Experiments with Magnetic Tweezers	38
3.1. Stalling experiments	38

3.2. Elastic transfer theory	40
3.3. Controlled rotation experiments	42
3.4. Rate constant of a free rotation experiment and the relation between controlled and free rotation experiments	43
3.5. Exponential rate and equilibrium constant versus rotor angle dependence of binding/release and catalysis	44
4. Theory of Long Time Binding Events in Controlled Rotation	47
4.1. Lifetime distributions and extraction of angle-dependent rate constants from long time binding events	47
4.2. Predictive calculation of lifetime distributions	48
5. Conclusions and Outlook	48
Acknowledgments	49
References	49
<b>Chapter 3 Redox- and Light-Driven Hydration Dynamics in Biological Energy Transduction</b>	<b>53</b>
<i>Ville R. I. Kaila</i>	
1. Introduction	53
2. Physical Principles of Redox- and Light-Driven Charge Transport	55
2.1. The electrostatic foundations	55
2.2. The electrostatic model applied to biological charge-separation	57
2.3. The molecular model	59
3. Long-Range Proton-Coupled Electron Transfer in Respiratory Complex I	59
3.1. Structure and function of complex I	59
3.2. Coupled electrostatic, hydration, and conformational changes trigger proton pumping	62
4. Redox-Coupled Proton-Pumping in Cytochrome <i>c</i> Oxidase	64
4.1. Structure and function of redox-driven proton pumping in CcO	64
4.2. Electrostatically-driven proton transfer dynamics	66
5. Light-Driven Ion Pumping in Microbial Rhodopsins	68
6. Redox-Coupled Substrate Water Deprotonation in Photosystem II	70
7. Conclusions	72
Acknowledgments	73
References and Citations	73
<b>Chapter 4 Reflections on Redox States in Enzymes</b>	<b>83</b>
<i>Per E. M. Siegbahn</i>	
1. Introduction	83
2. Photosystem II	84

3. Nitrogenase	86
4. Discussion	88
Acknowledgments	89
References and Citations	89
<b>Chapter 5 The Role of Singlet Oxygen in Photoinhibition of Photosystem II</b>	<b>91</b>
<i>Imre Vass</i>	
1. Introduction	92
2. Contrasting Mechanisms of PSII Photodamage	94
3. Production and Detection of $^1\text{O}_2$ in Photosynthetic Systems	95
4. Involvement of $^1\text{O}_2$ in Flashing Light Induced Photodamage of PSII	98
5. Involvement of $^1\text{O}_2$ in Continuous Illumination Induced Photodamage of PSII	99
5.1. Role of Phe/Phe <sup>-</sup> redox potential in $^1\text{O}_2$ dependent photodamage of PSII	99
5.2. Role of $\text{Q}_\text{A}/\text{Q}_\text{A}^-$ redox potential in $^1\text{O}_2$ dependent photodamage of PSII	100
5.3. The role of carotenoid mediated $^1\text{O}_2$ quenching and alternative electron transport pathways in photoprotection of PSII	101
6. Involvement of $^1\text{O}_2$ in the Inhibition of PSII Repair	102
7. Unresolved Questions	103
8. The Mechanism of $^1\text{O}_2$ Mediated Photoinhibition of PSII	106
9. Conclusions	108
Acknowledgments	109
References and Citations	109
<b>Chapter 6 Modular Assembly of ATP Synthase</b>	<b>119</b>
<i>John E. Walker, Jiuya He and Joe Carroll</i>	
1. Introduction	119
2. Assembly of Mitochondrial ATP Synthases	122
3. Modular Evolution of ATP Synthase	127
Acknowledgements	129
References	129
<b>Chapter 7 Cytochrome <i>c</i> Oxidase — Remaining Questions About the Catalytic Mechanism</b>	<b>135</b>
<i>Mårten Wikström and Vivek Sharma</i>	
1. Introduction	135
2. The Enigmatic O States	137

3. The Structures of the $O_H$ and O States	139
4. Peroxide in the Active Site?	141
5. Discussion	142
Acknowledgements	142
References	143
<b>Chapter 8 Cytochrome c Oxidase: Oxygen Consumption, Energy Conservation and Control</b>	<b>147</b>
<i>Peter R. Rich</i>	
1. Introduction: Oxygen Generation and Human Oxygen Consumption	148
2. Protein Structure and Electron Transfer	149
3. Coupled Proton Translocation	151
3.1. Structural aspects	151
3.2. General mechanism	152
3.3. Proton translocation in mammalian CcOs	155
4. Emerging Mechanisms of Control of Mammalian CcO	157
5. Concluding Remarks	159
Acknowledgements	159
References	159
<b>Chapter 9 Mimicking the Oxygen-Evolving Center in Photosystem II</b>	<b>167</b>
<i>Changhui Chen, Yang Chen and Chunxi Zhang</i>	
1. Introduction	167
2. Structure of the OEC	170
3. Challenge for the Synthesis of the OEC in Laboratory	174
4. Closer Mimicking of the OEC	176
5. Catalytic Activity of the $Mn_4CaO_4$ -Cluster	180
6. Implications for the Mechanism of the Water-Splitting Reaction in OEC	182
7. Conclusion	182
Acknowledgement	183
References	183
<b>Chapter 10 Protein Environment that Facilitates Proton Transfer and Electron Transfer in Photosystem II</b>	<b>191</b>
<i>Hiroshi Ishikita</i>	
1. Proton Transfer in PSII	192
1.1. Formation of low-barrier hydrogen bonds are required for proton transfer	192

1.2. Low-barrier hydrogen bonds in PSII	193
1.3. Release of protons from substrate water molecules in PSII	195
1.4. Can O5 be the deprotonation site?	196
1.5. Water channels near the $Mn_4CaO_5$ cluster	199
1.6. Summary of release of a proton from the substrate water molecule in the low S state transition	200
2. Electron Transfer in PSII	201
2.1. Redox potential values of cofactors in the electron transfer branches	201
2.2. Residues that are crucial to electron transfer are also crucial to proton transfer	203
Acknowledgments	205
References	205
<b>Chapter 11 Key Molecular Ru Complexes that have Fostered the Development and Understanding of Water Oxidation Catalysis</b>	<b>209</b>
<i>Carolina Gimbert Suriñach and Antoni Llobet</i>	
1. Introduction	209
2. Mononuclear Mono-Aqua Ru Complexes	212
2.1. Thermodynamic considerations	213
2.2. Access to high oxidation states and O–O bond formation	215
3. Mononuclear di-Aqua Ruthenium Complexes	216
4. Seven Coordinated Complexes	217
5. Multiple Ru-Aqua Complexes	219
6. Water Oxidation Induced by Light and Devices	221
7. Conclusions	224
8. Numbering Scheme	224
Acknowledgments	224
References	224
<b>Chapter 12 Material Design for Artificial Photosynthesis using Photoelectrodes for Hydrogen Production</b>	<b>231</b>
<i>Wilman Septina, James Barber and Lydia Helena Wong</i>	
1. Introduction	232
2. System Design for Artificial Photosynthesis	233
2.1. Single photoelectrode	234
2.2. Tandem photoelectrodes	234
2.3. Photovoltaic-photoelectrode	236

3. Materials Requirements	239
3.1. Light absorber	239
3.1.1. Energetic band alignment	240
3.1.2. Optical properties	241
3.1.3. Electronic properties	242
3.1.4. Morphology	244
3.2. Charge separation	245
3.2.1. Heterojunction	246
3.2.2. Internal electric field in the bulk materials	248
3.3. Catalyst	248
3.3.1. Hydrogen evolving catalyst	250
3.3.2. Oxygen evolving catalyst	250
4. Summary	253
References	253
<b>Chapter 13 Synthesis, Electronic Structure, and Spectroscopy of Multinuclear Mn Complexes Relevant to the Oxygen Evolving Complex of Photosystem II</b>	<b>259</b>
<i>Heui Beom Lee, Paul H. Oyala and Theodor Agapie</i>	
1. Introduction: S-state Intermediates in the Oxygen Evolving Complex of Photosystem II	260
2. Mixed-valent Mn <sup>III</sup> Mn <sup>IV</sup> Dinuclear Complexes	262
3. Mn <sub>3</sub> <sup>III</sup> Mn <sup>IV</sup> Complexes as Models of the S <sub>0</sub> State of the OEC	263
4. Mn <sub>2</sub> <sup>III</sup> Mn <sub>2</sub> <sup>IV</sup> Complexes as Models of the S <sub>1</sub> State of the OEC	265
5. Mn <sup>III</sup> Mn <sub>3</sub> <sup>IV</sup> Complexes as Models of the S <sub>2</sub> State of the OEC	266
6. Mn <sub>4</sub> <sup>IV</sup> Complexes as Models of the S <sub>3</sub> State of the OEC	269
7. Structurally Related Mn <sub>4</sub> Clusters with Variable Oxidation, Ancillary Ligand Coordination, and Mn Oxidation States	270
8. Concluding Remarks	278
References and Citations	279
<b>Chapter 14 Progress Towards Unraveling the Water-Oxidation Mechanism of Photosystem II</b>	<b>285</b>
<i>Hao-Li Huang, Ipsita Ghosh, Gourab Banerjee and Gary W. Brudvig</i>	
1. Introduction	285
2. Identification of Substrate Waters	290
2.1. <sup>18</sup> O-labeled substrate water exchange	290
2.2. Small molecules as substrate water analogues	292

2.1.1. Methanol	292
2.2.2. Ammonia	293
3. Probing Mechanistic Details with Kinetic Isotope Effects	294
3.1. H/D Kinetic isotope effects	295
3.2. $^{18}\text{O}$ Kinetic isotope effects	296
4. Effect of the Perturbation of the Hydrogen-Bonding Network on the Rate-Determining Step	297
4.1. Effect on steady-state oxygen-evolution and S-state cycling	298
4.2. Effect on oxygen-evolution kinetics	298
4.3. Is the rate-determining step different across species?	301
4.4. Effect of $\text{Ca}^{2+}$ and $\text{Cl}^-$ substitution	301
5. Conclusions	301
References	302

## **Chapter 15 Structure and Mechanism of Ni- and Fe-containing Carbon Monoxide Dehydrogenases 307**

*Holger Dobbek*

1. Introduction	307
2. Structure of CODHs	308
3. Active Site Cluster C	310
4. Mechanism of CO Oxidation at Cluster C	311
Acknowledgment	315
References and Citations	315

## **Chapter 16 Selective Replacement of the Damaged D1 Reaction Center Subunit During the Repair of the Oxygen-Evolving Photosystem II Complex 319**

*Shengxi Shao, Jianfeng Yu and Peter J. Nixon*

1. Introduction	320
2. The PSII Repair Cycle	322
2.1. Production of reactive species in PSII by visible light	323
2.2. Sites of damage in D1	324
2.3. Main proteases involved in degrading D1	324
2.4. Prompt selective repair <i>versus</i> emergency repair	325
3. Overview of FtsH Proteases and Mechanism	325
4. Recognition of Damaged D1 by FtsH	327
4.1. Importance of the N-terminal tail	327
4.2. Importance of accessibility for selective D1 degradation	328
4.3. What triggers detachment of CP43?	329
4.4. Incorporation of newly synthesized D1	330

5. Evolutionary Implications	331
6. Conclusions and Outlook	332
Acknowledgements	332
References	332
<b>Chapter 17 DFT Investigations on the Reaction Mechanisms in Photosynthetic Oxygen Evolution</b>	<b>339</b>
<i>Yu Guo</i>	
1. Introduction	339
2. Ammonia Binding to the OEC in the S <sub>2</sub> State	341
2.1. O5 substitution scheme	342
2.1.1. Closed-cubane structure as the reactant	342
2.1.2. Open-cubane structure as the reactant	345
2.2. W1 substitution scheme	347
2.3. Mn4 addition scheme	350
2.4. Implications for oxygen evolution style	352
3. Mechanism of O–B Bond Formation in the S <sub>4</sub> State	352
3.1. Potential energy surface investigations	353
3.2. The open-cubane oxo-oxyl coupling as the energetically optimal mechanism	353
3.3. Correlations to recent experimental revelations	357
4. Appendix	358
Acknowledgments	359
References and Citations	359
<b>Chapter 18 Local Cycle of Photosynthesis and Quasi-Aerobic Respiration Facilitated by Manganese Oxides — A Hypothesis on the Evolution of Phototrophy</b>	<b>367</b>
<i>Holger Dau, Dennis J. Nürnberg and Robert Burnap</i>	
1. The World of Manganese Oxides	368
1.1. Structure and formation of (inorganic) manganese oxides	368
1.2. Biogenic manganese oxides and bacterial metal oxide metabolism	371
1.2.1. Formation of manganese deposits	371
1.2.2. Manganese oxide reduction in bacterial respiration	372
1.2.3. Bacterial manganese oxide formation	375
1.3. The manganese complex of photosynthetic water oxidation	376
1.3.1. Structure of the photosystem II (PSII) manganese complex	376
1.3.2. Assembly (photoactivation) of the PSII manganese complex	378
1.3.3. Variation of PSII core subunit D1 (PsbA)	379
1.3.4. Location of PSII in the photosynthetic cell	380

2. Hypothesis — Manganese Oxides Facilitated Quasi-Aerobic Photosynthesis and Respiration	381
2.1. Has the biological catalyst initially been created from external $Mn^{3+/4+}$ oxide particles? No, the other way around, an ancient photosystem was a manganese oxide producer	381
2.2. Local cycle of photosynthetic production of manganese oxides and their use as oxidants by (i) heterotrophic bacteria or (ii) the photosynthetic organisms	382
2.3. Local cycle of photosynthesis and quasi-aerobic respiration of the photosynthetic organisms based on the $Mn^{2+}/MnO_2$ redox couple	384
3. Verification of the Proposed Photosynthetic-Respiratory Manganese Oxide Cycle?	388
Acknowledgments	390
References and Citations	391
<b>Chapter 19 A Perspective on a Paradigm Shift in Plant Photosynthesis: Designing a Novel Type of Photosynthesis in Sorghum by Combining <math>C_3</math> and <math>C_4</math> Metabolism</b>	<b>397</b>
<i>Christer Jansson, Todd Mockler, John P. Vogel, Henrique DePaoli, Samuel P. Hazen, Venkat Srinivasan, Asaph Cousins, Peggy Lemaux, Jeff Dahlberg and Tom Brutnell</i>	
1. Sorghum — A Versatile Super Crop	398
2. The Benefits of $C_4$ Photosynthesis	398
3. The Shortcomings of $C_4$ Photosynthesis	400
4. Designing Dual $C_3$ - $C_4$ Photosynthesis	402
Acknowledgments	407
References and Citations	408
