
Detailed table of contents

List of contributors	xiii
1 Introduction	1
Gabriel Gellner, Kevin S. McCann, and Emily J. Champagne	
1.1 This book and its predecessors	1
1.2 This book: Themes and directions	2
2 Species coexistence	5
Peter Chesson	
2.1 Introduction	5
2.2 Models	6
2.3 Overall interaction and average fitness differences	11
2.4 Competition for resources	12
2.5 Role of natural enemies	15
2.6 Role of environmental variation	18
2.7 Discussion	21
Acknowledgments	24
References	24
3 The synergistic effects of interaction strength and lags on ecological stability	28
Gabriel Gellner, Kevin S. McCann, and Christopher Greyson-Gaito	
3.1 Introduction	28
3.2 Population models: The interactive role of growth and lags	31
3.3 Consumer-Resource models: The interactive role of IS and lags	34
3.4 Lag excitation and lag interference	36
3.5 Asynchrony as a form of lag interference?	36
3.6 Summary	38
References	38
4 Non-equilibrium dynamics and stochastic processes	40
Karen C. Abbott	
4.1 Introduction to stochasticity and transients	40
4.2 Challenge 1: Stability in stochastic ecological systems	42
4.2.1 Why is this a challenge for non-equilibrium systems?	42
4.2.2 A way forward	44
4.2.3 Lesson from Challenge 1: Non-equilibrium dynamics strengthen ecological understanding	46

4.3	Challenge 2: Predicting regime shifts	46
4.3.1	Why is this a challenge for non-equilibrium systems?	46
4.3.2	A way forward	46
4.3.3	Lesson from Challenge 2: Unstable equilibria can reveal a lot about non-equilibrium dynamics	49
4.4	Building on these lessons to confront future challenges	50
	References	51
5	The impact of population structure on population and community dynamics	53
	André M. de Roos	
5.1	Introduction	53
5.2	State concepts in SPMs	54
5.3	Types of structured population models	55
5.4	Ecological consequences of changing population structure	60
5.4.1	Juvenile and adult-driven population cycles	60
5.4.2	Biomass overcompensation	62
5.4.3	Community consequences of biomass overcompensation	64
5.5	Interfacing theory and data	67
5.6	On generality and model specificity	69
5.7	Outlook	70
	References	71
6	Models for large ecological communities—a random matrix approach	74
	Stefano Allesina and Jacopo Grilli	
6.1	Introduction	74
6.2	May's stability criterion	75
6.3	Random matrices	78
6.4	Fundamental results	79
6.5	Structured random matrices	83
6.6	Other applications	88
6.7	Open problems and conclusions	89
	References	91
7	A structural theory of mutualistic networks	93
	Jordi Bascompte and Antonio Ferrera	
7.1	Introduction	93
7.2	A purely dynamic stability approach to mutualistic networks	95
7.2.1	Early models	95
7.2.2	Adding non-linear functional responses	95
7.2.3	Adding interspecific competition within sets	97
7.3	A structural stability approach to mutualistic networks	99
7.3.1	Preliminary work on the limits to the number of coexisting species in purely competitive systems	99
7.3.2	Limits to the number of coexisting species in systems with competition plus mutualism	104
7.3.3	Robustness of mutualistic networks	108
7.4	Concluding remarks	113
	References	114

8	Theoretical ecology, concepts, and applications: A data-driven approach to complex ecological systems	116
	Michio Kondoh, Kazutaka Kawatsu, Yutaka Osada, and Masayuki Ushio	
8.1	Interspecific interactions and ecological dynamics	116
8.1.1	Population dynamics and interspecific interactions	116
8.1.2	Community dynamics and interspecific interactions	117
8.2	Nature of population-level interspecific interactions	119
8.2.1	Diversity in behavioral mechanisms	119
8.2.2	Scale dependency of interspecific interactions	119
8.2.3	Dynamic nature of interspecific interactions	120
8.3	How to study interspecific interactions in nature	121
8.3.1	Identifying population-level interactions	121
8.3.2	Identification of interactions based on behavior by individuals	121
8.3.3	Manipulative field experiments	122
8.4	Modern Data-Driven approach to interspecific interactions	123
8.4.1	Estimating population-level interactions from time-series data	123
8.4.2	Convergent cross mapping and multivariate S-map	124
8.4.3	Application of EDM to interaction network studies	125
8.5	Conclusion and future directions	128
	References	129
9	Trait-based models of complex ecological networks	134
	Ulrich Brose	
9.1	Modeling complex ecological networks	134
9.2	Allometric population models	136
9.3	Allometric models of complex communities: The Yodzis and Innes approach	137
9.4	More complex allometries	138
9.5	Modeling the temperature-dependence of network dynamics	139
9.6	Outlook	139
	References	141
10	Ecological networks: From structure to dynamics	143
	Sonia Kéfi	
10.1	Brief introduction	143
10.2	What is a network?	144
10.3	Networks in ecology	146
10.3.1	Interaction networks	146
10.3.2	Toward multi-layer interaction networks	147
10.3.3	Other types of ecological networks	147
10.3.4	Broad questions asked in ecological networks	149
10.4	Quantifying networks structure	149
10.4.1	Local network descriptors	150
10.4.2	Quasi-local network descriptors (intermediate description level)	150
10.4.3	Global network descriptors	150
10.4.4	Extensions to multilayer networks	152
10.5	Structural properties of ecological networks	152
10.5.1	Food webs	152

10.5.2	Mutualistic webs	154
10.6	From the structure to the dynamics of ecological networks	154
10.7	Challenges	155
10.8	Conclusion	157
	References	157

11 Trait-based ecological and eco-evolutionary theory **161**

Christopher A. Klausmeier, Colin T. Kremer, and Thomas Koffel

11.1	Overview of trait-based ecology and evolution	161
11.1.1	Why trait-based ecology?	161
11.1.2	What are traits?	162
11.1.3	Historical survey of trait-based theories	162
11.1.4	Overview of rest of chapter	164
11.2	Basic ideas	165
11.2.1	Density-independent models with traits and optimization theory	165
11.2.2	Density-dependent models with traits	167
11.2.3	Applications	175
11.3	Other trait-based frameworks	176
11.4	Extensions/Complications	180
11.4.1	Traits in time	180
11.4.2	Traits in space	181
11.4.3	Multiple traits	183
11.5	Frontiers of trait-based modeling	184
11.5.1	Comparisons with empirical systems	184
11.5.2	Linking trait- and species-based approaches	185
11.5.3	Using trait-based theory to improve Earth Systems Models	186
11.5.4	Final thoughts	187
	References	187

12 Toward a general theory of metacommunity ecology **195**

Dominique Gravel and François Massol

12.1	Introduction	195
12.2	A general model for "meta" ecology	196
12.2.1	The heritage of the Levins' model of colonization and extinction dynamics	197
12.2.2	Local demography versus regional processes	198
12.3	Spatial heterogeneity	198
12.3.1	Environmental variation	198
12.3.2	Dispersal limitation	201
12.4	Coexistence and Persistence	202
12.4.1	Introducing species interactions	202
12.4.2	Technique for invasibility analysis	204
12.4.3	Competition	204
12.4.4	Food webs	210
12.4.5	Mutualism	210
12.5	Moments of metacommunities	211
12.5.1	Competition	211

12.5.2	Predator-prey interactions	212
12.6	Discussion	213
12.6.1	Extension to multi-species communities	214
12.6.2	From coexistence to dynamical stability	215
12.7	Conclusion	217
	References	217
13	Theories of diversity in disease ecology	221
	T. Alex Perkins and Jason R. Rohr	
13.1	Introduction	221
13.2	Host diversity	222
13.2.1	The basics of host diversity–infectious disease theory	223
13.2.2	Mechanisms for host diversity–infectious disease interactions	224
13.2.3	Evidence in support of proposed mechanisms for host diversity–infectious disease interactions	225
13.2.4	Application of theory on host diversity to disease management	226
13.3	Pathogen diversity	227
13.3.1	A community ecology framework for pathogen coexistence	227
13.3.2	A diverse web of interactions among pathogens	228
13.3.3	Theoretical results about pathogen coexistence	229
13.3.4	Application of theories of pathogen diversity to disease management	231
13.4	Are theories of host and pathogen diversity ships passing in the night?	232
13.5	Diversifying the use of theory to address questions of diversity in disease ecology	233
	Acknowledgments	235
	References	235
14	The impact of temperature on population and community dynamics	243
	David A. Vasseur	
14.1	Introduction	243
14.2	Population dynamics in varying environments	244
14.3	Focusing our paradigm: Which parameters of trophic models should we study?	246
14.4	Temperature dependence of carrying capacity	249
14.5	Unimodal responses and community dynamics	250
14.6	Warming and food webs	251
14.7	Temperature variation at shorter time scales	251
14.8	Deriving an r-K temperature dependent model	252
14.9	Temperature by density interactions	254
14.10	Temperature variation, dynamics, and extinction in r-K models	255
14.11	Summary and future directions	258
	References	259
15	Alternative stable states, tipping points, and early warning signals of ecological transitions	263
	John M. Drake, Suzanne M. O’Regan, Vasilis Dakos, Sonia Kéfi, and Pejman Rohani	
15.1	Introduction	263

15.1.1	Tipping points in dynamical systems	263
15.1.2	Early warning signals	264
15.1.3	Bifurcation delay	268
15.2	Theory	268
15.2.1	Birth-death processes	268
15.2.2	Case Study 1: The Logistic model with harvesting	269
15.2.3	Case Study 2: The Levin's metapopulation model	271
15.3	Empirical evidence	273
15.3.1	Lab experiments	273
15.3.2	Field experiments	276
15.3.3	Observational studies	277
15.4	Spatial indicators of resilience	277
15.4.1	Critical slowing down spatial indicators	278
15.4.2	Two broad types of patterns in drylands	278
15.4.3	Structural early warning signals	282
15.5	Conclusion	282
	Acknowledgments	282
	References	282
16	Areas of current and future growth	285
