

2.12 Z-form DNA is a left-handed double-helical structure 62

2.13 The DNA double helix is quite deformable 65

2.14 DNA supercoiling can occur when the ends of double helices are constrained 67

2.15 The writhe, twist, and linking number are related to each other in a simple way 69

2.16 The writhe, twist, and linking number are related to each other in a simple way 70

2.17 The DNA in cells is supercoiled 71

2.18 Local conformational changes in the DNA also affect supercoiling 72

**How Do We Understand Life?**

**PART I: BIOLOGICAL MOLECULES**

Chapter 1 From Genes to RNA and Proteins 1

Chapter 2 Nucleic Acid Structure 4

Chapter 3 Glycans and Lipids 5

Chapter 4 Protein Structure 51

Chapter 5 Evolutionary Variation in Proteins 91

**PART II: ENERGY AND ENTROPY**

Chapter 6 Energy and Intermolecular Forces 131

Chapter 7 Entropy 191

Chapter 8 Linking Energy and Entropy: The Boltzmann Distribution 238

**PART III: FREE ENERGY**

Chapter 9 Free Energy 239

Chapter 10 Chemical Potential and the Drive to Equilibrium 293

Chapter 11 Voltages and Free Energy 341

**PART IV: MOLECULAR INTERACTIONS**

Chapter 12 Molecular Recognition: The Thermodynamics of Binding 382

Chapter 13 Specificity of Macromolecular Recognition 383

Chapter 14 Allostery 413

**PART V: KINETICS AND CATALYSIS**

Chapter 15 The Rates of Molecular Processes 459

Chapter 16 Principles of Enzyme Catalysis 530

Chapter 17 Diffusion and Transport 672

**PART VI: ASSEMBLY AND ACTIVITY**

Chapter 18 Folding 673

Chapter 19 Fidelity in DNA and Protein Synthesis 721

Glossary 787

B. LIPIDS AND MEMBRANES 801

3.13 The most abundant lipids are glycerophospholipids 101

3.14 Other classes of lipids have different molecular frameworks 107

3.15 Lipids form micelles and bilayers 111

3.16 Lipids in bilayers move freely in two dimensions 115

3.17 Lipid composition affects the physical properties of membranes 118
