Preface	v
1 Important Concepts in Mathematical Modeling of Infectious Diseases	1
1.1 Mathematical Modeling of Infectious Diseases: Issues and Approaches	1
1.2 Deterministic Epidemic Models: Compartmental Approach	6
1.3 An Example: Kermack–McKendrick Model	8
1.4 Important Concepts in Compartmental Epidemic Models	11
2 Five Classic Epidemic Models and Their Analysis	35
2.1 Kermack–McKendrick Model	37
2.2 A Model for Diseases with No Immunity	46
2.3 A Model with Demography	52
2.4 An SIR Model with Varying Total Population: Homogeneous Systems	60
2.5 Ross–MacDonald Model for Malaria: A Monotone System	68
3 Basic Mathematical Tools and Techniques	79
3.1 Stability of Equilibrium Solutions	79
3.2 Stability Analysis by Linearization	81

3.3	Stability Analysis Using Lyapunov Functions	82
3.4	Stability of Periodic Solutions: The Floquet Theory	84
3.5	Global Dynamics of 1-Dimensional Systems: Phase-Line Analysis	87
3.6	Global Dynamics of 2-Dimensional Systems: Phase-Plane Analysis	90
3.7	Uniform Persistence	95
3.8	Metzler Matrices and Monotone Systems	98
4	Parameter Estimation and Nonlinear Least-Squares Methods	103
4.1	Curve-Fitting and Linear Least-Squares Problem	104
4.2	Nonlinear Least-Squares Problem	111
4.3	Parameter Estimation for Epidemic Models	118
5	Special Topics	125
5.1	Higher Dimensional Models: SEIR Models	126
5.2	In-host Models and Backward Bifurcation	136
	Bibliography	151
	Index	155
