

Contents

Preface	Toward a postmodern synthesis of evolutionary biology	vii
Chapter 1:	The fundamentals of evolution: Darwin and Modern Synthesis	1
Chapter 2:	From Modern Synthesis to evolutionary genomics: Multiple processes and patterns of evolution	21
Chapter 3:	Comparative genomics: Evolving genomesapes	49
Chapter 4:	Genomics, systems biology, and universals of evolution: Genome evolution as a phenomenon of statistical physics	81
Chapter 5:	The web genomics of the prokaryotic world: Vertical and horizontal flows of genes, the mobilome, and the dynamic pangenomes . . .	105
Chapter 6:	The phylogenetic forest and the quest for the elusive Tree of Life in the age of genomics	145
Chapter 7:	The origins of eukaryotes: Endosymbiosis, the strange story of introns, and the ultimate importance of unique events in evolution . . .	171
Chapter 8:	The non-adaptive null hypothesis of genome evolution and origins of biological complexity	225
Chapter 9:	The Darwinian, Lamarckian, and Wrightean modalities of evolution, robustness, evolvability, and the creative role of noise in evolution	257
Chapter 10:	The Virus World and its evolution	293
Chapter 11:	The Last Universal Common Ancestor, the origin of cells, and the primordial gene pool	329

Chapter 12:	Origin of life: The emergence of translation, replication, metabolism, and membranes—the biological, geochemical, and cosmological perspectives	351
Chapter 13:	The postmodern state of evolutionary biology	397
Appendix A:	Postmodernist philosophy, metanarratives, and the nature and goals of the scientific endeavor	421
Appendix B:	Evolution of the cosmos and life: Eternal inflation, “many worlds in one,” anthropic selection, and a rough estimate of the probability of the origin of life	431
