Preface *page* xiii
Acknowledgements xx
Main Symbols and Acronyms xxi

1 Dimensional Analysis for Climate Science 1
1.1 Dimension and Units 1
1.2 Fundamental Dimensions: $LMT\theta I$-class 2
1.3 Dimensional Analysis for a Simple Pendulum 6
1.4 Dimensional Analysis for the State Equation of Air 8
1.5 Dimensional Analysis of Heat Diffusion 8
1.6 Dimensional Analysis of Rossby Waves and Kelvin Waves 10
1.6.1 Parameters for Rossby Waves 10
1.6.2 Non-Dispersive Properties of Kelvin Waves 13
1.7 Estimating the Shock Wave Radius of a Nuclear Explosion by Dimensional Analysis 13
1.8 Chapter Summary 15
References and Further Readings 16
Exercises 17

2 Basics of R Programming 21
2.1 Download and Install R and RStudio 21
2.2 R Tutorial 23
2.2.1 R As a Smart Calculator 23
2.2.2 Define a Sequence in R 24
2.2.3 Define a Function in R 25
2.2.4 Plot with R 25
2.2.5 Symbolic Calculations by R 26
2.2.6 Vectors and Matrices 27
2.2.7 Simple Statistics by R 29
2.3 Online Tutorials 31
2.3.1 YouTube Tutorial: For True Beginners 31
2.3.2 YouTube Tutorial: For Some Basic Statistical Summaries 31
2.3.3 YouTube Tutorial: Input Data by Reading a csv File into R 31
2.4 Chapter Summary 32
References and Further Readings 33
Exercises 34

3 Basic Statistical Methods for Climate Data Analysis 37
3.1 Statistical Indices from the Global Temperature Data from 1880 to 2015 37
3.1.1 Mean, Variance, Standard Deviation, Skewness, Kurtosis, and Quantiles 38
3.1.2 Correlation, Covariance, and Linear Trend 40
3.2 Commonly Used Statistical Plots 43
3.2.1 Histogram of a Set of Data 43
3.2.2 Box Plot 43
3.2.3 Scatter Plot 45
3.2.4 Q–Q Plot 47
3.3 Probability Distributions 48
3.3.1 What Is a Probability Distribution? 48
3.3.2 Normal Distribution 52
3.3.3 Student's t-distribution 53
3.4 Estimate and Its Error 55
3.4.1 Probability of a Sample inside a Confidence Interval 55
3.4.2 Mean of a Large Sample Size: Approximately Normal Distribution 57
3.4.3 Mean of a Small Sample Size t-Test 64
3.5 Statistical Inference of a Linear Trend 67
3.6 Free Online Statistics Tutorials 69
3.7 Chapter Summary 70
References and Further Readings 71
Exercises 72

4 Climate Data Matrices and Linear Algebra 75
4.1 Matrix as a Data Array 75
4.2 Matrix Algebra 76
4.2.1 Matrix Equality, Addition, and Subtraction 77
4.2.2 Matrix Multiplication 78
4.3 A Set of Linear Equations 82
4.4 Eigenvalues and Eigenvectors of a Square Space Matrix 83
4.4.1 Matrices of Data Anomalies, Standardized Anomalies, Covariance, and Correlation 84
4.4.2 Eigenvectors and Their Corresponding Eigenvalues 85
4.5 An SVD Representation Model for Space–Time Data 87
4.6 SVD Analysis of Southern Oscillation Index 91
4.6.1 Standardized SLP Data and SOI 91
4.6.2 Weighted SOI Computed by the SVD Method 94
4.6.3 Visualization of the ENSO Mode Computed from the SVD Method 98
4.7 Mass Balance for Chemical Equations in Marine Chemistry 100
4.8 Multivariate Linear Regression Using Matrix Notations 101
4.9 Chapter Summary 103
References and Further Readings 105
Exercises 106

5 Energy Balance Models for Climate 108
5.1 EBM for Modeling the Moon's Surface Temperature 108
5.1.1 Moon–Earth–Sun Orbit and Lunar Surface 109
5.1.2 Moon's Surface Temperature 110
5.1.3 EBM Prediction for the Moon Surface Temperature 113
5.2 EBM for the Global Average Surface Temperature of the Earth: A Zero-Dimensional Climate Model 116
5.2.1 The Incoming Power from the Solar Radiation to the Earth 117
5.2.2 The Outgoing Power from Long-Wave Radiation Emitted by the Earth 118
5.2.3 EBM as a Power Balance 119
5.3 EBM for the Global Average Surface Temperature of an Earth with a Nonlinear Albedo Feedback 120
5.4 Time-Dependent Zero-Dimensional EBM for the Earth's Global Average Surface Temperature 123
5.4.1 An EBM Including Time Dependence 124
5.4.2 Stability Analysis of the Multiple Solutions of the EBM with a Nonlinear Albedo Feedback 125
5.4.3 Energy Flow Budget and Greenhouse Effect for the Earth's Climate 126
5.5 Increasing the Complexity of Climate Models 129
5.6 Chapter Summary 131
References and Further Readings 132
Exercises 136

6 Calculus Applications to Climate Science I: Derivatives 138
6.1 Stefan–Boltzmann Law and Budyko's Approximation 138
6.2 Linear Approximation 141
6.3 Bisection Method for Solving Nonlinear Equations 143
6.4 Newton's Method 145
6.5 Examples of Higher-Order Derivatives 148
6.6 Pressure Gradient Force and Coriolis Force 151
6.7 Spatiotemporal Variations of the Atmospheric and Oceanic Temperature Fields 153
6.8 Taylor Polynomial as a High-Order Approximation 155
6.8.1 Taylor's Theorem 156
6.8.2 Taylor Series Example: Exponential Function 161
6.8.3 Numerical Integration Using Taylor Expansion 162
6.9 Chapter Summary 163
References and Further Readings 165
Exercises 166

7 Calculus Applications to Climate Science II: Integrals 169
7.1 Geopotential and Atmospheric Pressure 169

7.1.1 Vertical Forces on a Small Parcel of Atmosphere 169
7.1.2 Geopotential 173
7.2 Hypsometric Equation: Exponential Decrease of Pressure with Respect to Elevation 175
7.2.1 The General Hypsometric Equation 175
7.2.2 An Application of the Hypsometric Equation: Calculate the Elevation of Mount Mitchell 181
7.2.3 Hypsometric Equation for an Isothermal Layer 182
7.2.4 Error Estimate of the Linear Approximation to the Hypsometric Equation 184
7.2.5 Applications of Geopotential Height in Radiosonde Measurements 185
7.3 Work Done by an Air Mass in Expansion 187
7.4 Internal Energy, Enthalpy, and Entropy 188
7.4.1 Internal Energy and Enthalpy 188
7.4.2 Entropy 191
7.5 Use of Integrals to Derive Stefan–Boltzmann's Blackbody Radiation Formula from Planck's Law of Radiation 191
7.6 Chapter Summary 196
References and Further Readings 197
Exercises 199

8 Conservation Laws in Climate Dynamics 203
8.1 Conservation of Mass 203
8.1.1 Basic Elements of the Continuum Mechanics Method for Climate Modeling 204
8.1.2 Lagrangian and Eulerian Observers, and Mass Conservation in the Lagrangian Framework 205
8.1.3 Total Derivative 207
8.1.4 Mass Conservation in the Eulerian Framework 208
8.2 Conservation of Momentum Over a Grid Box: $\mathbf{F} = m\mathbf{a}$ 212
8.3 The Equations of Momentum Conservation in x, y, z, t Coordinates 215
8.4 Geostrophic Approximation of the Momentum Equations 217
8.4.1 Mathematical Description of the Geostrophic Approximation 218
8.4.2 Flow Direction Perpendicular to the PGF under the Geostrophic Approximation 218
8.5 The Potential Vorticity Conservation Equation 220
8.5.1 Absolute Vorticity and Relative Vorticity 220
8.5.2 Potential Vorticity and Its Conservation 220
8.5.3 Mathematical Derivations of the Conservation of Potential Vorticity 221
8.6 Chapter Summary 224
References and Further Readings 226
Exercises 227

9 R Graphics for Climate Science 229
9.1 Two-Dimensional Line Plots and Setups of Margins and Labels 229
9.1.1 Plot Two Different Time Series on the Same Plot 229
9.1.2 Figure Setups: Margins, Fonts, Mathematical Symbols, and More 231
9.1.3 Plot Two or More Panels on the Same Figure 234
9.2 Color Contour Maps 235
9.2.1 Basic Principles for an R Contour Plot 235
9.2.2 Plot Contour Color Maps for Random Values on a Map 235
9.2.3 Plot Contour Maps from Climate Model Data in NetCDF Files 237
9.3 Plot Wind Velocity Field on a Map 243
9.3.1 Plot a Wind Field Using `arrow.plot` 243
9.3.2 Plot a Surface Wind Field from netCDF Data 244
9.4 ggplot for Data 246
9.5 Animation 247
9.6 Chapter Summary 249
References and Further Readings 250
Exercises 251

10 Advanced R Analysis and Plotting: EOFs, Trends, and Global Data 253
10.1 Ideas of EOF, PC, and Variances Computed from SVD 253
10.2 2Dim Spatial Domain EOFs and 1Dim Temporal PCs 254
10.2.1 Generate Synthetic Data by R 254
10.2.2 SVD for the Synthetic Data EOFs, Variances, and PCs 256
10.3 From Climate Data Download to EOF and PC Visualization: An NCEP/NCAR Reanalysis Example 260
10.3.1 Download and Visualize the NCEP Temperature Data 260
10.3.2 Space–Time Data Matrix and SVD 262
10.4 Area-Weighted Average and Spatial Distribution of Trend 270
10.4.1 Global Average and PC1 270
10.4.2 Spatial Pattern of Linear Trends 271
10.5 GPCP Precipitation Data: Analysis and Visualization by R 272
10.5.1 Read and Write GPCP Data 273
10.5.2 GPCP Climatology and Standard Deviation 275
10.6 Chapter Summary 277
References and Further Readings 278
Exercises 278

11 R Analysis of Incomplete Climate Data 281
11.1 The Missing Data Problem 281
11.2 Read NOAAGlobalTemp and Form the Space–Time Data Matrix 282
11.2.1 Read the Downloaded Data 283
11.2.2 Plot the Temperature Data Map of a Given Month 285
11.2.3 Extract the Data for a Specified Region 285

11.2.4 Extract Data from Only One Grid Box 287
11.3 Spatial Averages and Their Trends 287
11.3.1 Compute and Plot the Global Area-Weighted Average of Monthly Data 287
11.3.2 Percent Coverage of the NOAAGlobalTemp 288
11.3.3 Compare Trends and Variances at Two Different Locations 289
11.3.4 Which Month Has the Strongest Trend? 291
11.3.5 Spatial Average of Annual Data 293
11.3.6 Nonlinear Trend of the Global Average Annual Mean Data 293
11.4 Spatial Characteristics of the Temperature Change Trends 295
11.4.1 The Twentieth-Century Temperature Trend 295
11.4.2 Twentieth-Century Temperature Trend Computed under a Relaxed Condition 297
11.4.3 Trend Pattern for the Four Decades of Consecutive Warming: 1976–2016 298
11.5 Chapter Summary 299
References and Further Readings 300
Exercises 301
Appendix A Dot Product of Two Vectors 303
A.1 Two Definitions for the Dot Product 303
A.2 Solar Power Flux to the Earth's Surface and Seasonality 305
A.3 Divergence Theorem for the Mass Continuity Equation in Climate Models 305
Appendix B Cross Product of Two Vectors 307
B.1 Definition of the Cross Product of Two Vectors 307
B.2 Coriolis Force 309
B.3 Vorticity 309
B.4 Stokes' Theorem 310
Appendix C Spherical Coordinates 314
C.1 Transform between the Spherical Coordinates and Cartesian Coordinates 314
C.2 Area and Volume Differentials in Spherical Coordinates 315
Appendix D Calculus Concepts and Methods for Climate Science 318
D.1 Descartes' Direct Calculus for Functions of a Single Variable 318
D.2 Calculus from a Statistics Perspective 338
D.3 Differentiation Methods and Higher Derivatives 348
D.4 Calculus for Functions of Two and More Variables 351
References and Further Readings 364
Exercises 367
Appendix E Sample Solutions to the Climate Mathematics Exercises 371
Glossary 380
Index 386
