On the Cover

Despite the ever-growing number of devices and techniques the successful treatment of acutely ruptured and wide-necked aneurysms still remains difficult even in the most experienced of hands. Comaneci (Rapid Medical, Israel) is a new radiopaque, non-occlusive and fully retrievable neck

bridging device, designed to facilitate coil embolization of complex and wide-necked cerebral aneurysms. This artist's rendition illustrates the critical advantage of this conceptually new technique and device. It offers the ability to temporarily create a manually adjustable scaffold across the aneurysmal neck but without disrupting the blood flow in the parent artery. A benefit that can negate the potential complications of balloon or stent-assisted coiling in acute setting. Read more in "Comaneci-Assisted Coiling as a Treatment Option for Acutely Ruptured Wide Neck Cerebral Aneurysm: Case Series of 118 Patients", published in the December 2020 issue of *Neurosurgery*. © Anton Robov, 2020, used with permission.
