

## Table of contents

<b>XV CREATION AND ANNIHILATION OPERATORS FOR IDENTICAL PARTICLES</b>	<b>1591</b>
A General formalism . . . . .	1592
B One-particle symmetric operators . . . . .	1603
C Two-particle operators . . . . .	1608
<b>READER'S GUIDE FOR COMPLEMENTS</b>	<b>1617</b>
<b>A<sub>xv</sub> Particles and holes</b>	<b>1621</b>
1 Ground state of a non-interacting fermion gas . . . . .	1621
2 New definition for the creation and annihilation operators . . . . .	1622
3 Vacuum excitations . . . . .	1623
<b>B<sub>xv</sub> Ideal gas in thermal equilibrium; quantum distribution functions</b>	<b>1625</b>
1 Grand canonical description of a system without interactions . . . . .	1626
2 Average values of symmetric one-particle operators . . . . .	1628
3 Two-particle operators . . . . .	1631
4 Total number of particles . . . . .	1635
5 Equation of state, pressure . . . . .	1640
<b>C<sub>xv</sub> Condensed boson system, Gross-Pitaevskii equation</b>	<b>1643</b>
1 Notation, variational ket . . . . .	1643
2 First approach . . . . .	1645
3 Generalization, Dirac notation . . . . .	1648
4 Physical discussion . . . . .	1651
<b>D<sub>xv</sub> Time-dependent Gross-Pitaevskii equation</b>	<b>1657</b>
1 Time evolution . . . . .	1657
2 Hydrodynamic analogy . . . . .	1664
3 Metastable currents, superfluidity . . . . .	1667
<b>E<sub>xv</sub> Fermion system, Hartree-Fock approximation</b>	<b>1677</b>
1 Foundation of the method . . . . .	1678
2 Generalization: operator method . . . . .	1688

<b>F<sub>XV</sub> Fermions, time-dependent Hartree-Fock approximation</b>	<b>1701</b>
1 Variational ket and notation . . . . .	1701
2 Variational method . . . . .	1702
3 Computing the optimizer . . . . .	1705
4 Equations of motion . . . . .	1707
<b>G<sub>XV</sub> Fermions or Bosons: Mean field thermal equilibrium</b>	<b>1711</b>
1 Variational principle . . . . .	1712
2 Approximation for the equilibrium density operator . . . . .	1716
3 Temperature dependent mean field equations . . . . .	1725
<b>H<sub>XV</sub> Applications of the mean field method for non-zero temperature</b>	<b>1733</b>
1 Hartree-Fock for non-zero temperature, a brief review . . . . .	1733
2 Homogeneous system . . . . .	1734
3 Spontaneous magnetism of repulsive fermions . . . . .	1737
4 Bosons: equation of state, attractive instability . . . . .	1745
*****	
<b>XVI FIELD OPERATOR</b>	<b>1751</b>
A Definition of the field operator . . . . .	1752
B Symmetric operators . . . . .	1755
C Time evolution of the field operator (Heisenberg picture) . . . . .	1763
D Relation to field quantization . . . . .	1765
<b>READER'S GUIDE FOR COMPLEMENTS</b>	<b>1767</b>
<b>A<sub>XVI</sub> Spatial correlations in an ideal gas of bosons or fermions</b>	<b>1769</b>
1 System in a Fock state . . . . .	1769
2 Fermions in the ground state . . . . .	1771
3 Bosons in a Fock state . . . . .	1775
<b>B<sub>XVI</sub> Spatio-temporal correlation functions, Green's functions</b>	<b>1781</b>
1 Green's functions in ordinary space . . . . .	1781
2 Fourier transforms . . . . .	1790
3 Spectral function, sum rule . . . . .	1795
<b>C<sub>XVI</sub> Wick's theorem</b>	<b>1799</b>
1 Demonstration of the theorem . . . . .	1799
2 Applications: correlation functions for an ideal gas . . . . .	1804
*****	
<b>XVII PAIRED STATES OF IDENTICAL PARTICLES</b>	<b>1811</b>
A Creation and annihilation operators of a pair of particles . . . . .	1813
B Building paired states . . . . .	1818
C Properties of the kets characterizing the paired states . . . . .	1822
D Correlations between particles, pair wave function . . . . .	1830
E Paired states as a quasi-particle vacuum; Bogolubov-Valatin transformations	1836

<b>Axvii Pair field operator for identical particles</b>	<b>1845</b>
1 Pair creation and annihilation operators . . . . .	1846
2 Average values in a paired state . . . . .	1851
3 Commutation relations of field operators . . . . .	1861
<b>Bxvii Average energy in a paired state</b>	<b>1869</b>
1 Using states that are not eigenstates of the total particle number . . . . .	1869
2 Hamiltonian . . . . .	1871
3 Spin 1/2 fermions in a singlet state . . . . .	1874
4 Spinless bosons . . . . .	1881
<b>Cxvii Fermion pairing, BCS theory</b>	<b>1889</b>
1 Optimization of the energy . . . . .	1890
2 Distribution functions, correlations . . . . .	1899
3 Physical discussion . . . . .	1914
4 Excited states . . . . .	1919
<b>Dxvii Cooper pairs</b>	<b>1927</b>
1 Cooper model . . . . .	1927
2 State vector and Hamiltonian . . . . .	1927
3 Solution of the eigenvalue equation . . . . .	1929
4 Calculation of the binding energy for a simple case . . . . .	1929
<b>E XVII Condensed repulsive bosons</b>	<b>1933</b>
1 Variational state, energy . . . . .	1935
2 Optimization . . . . .	1937
3 Properties of the ground state . . . . .	1940
4 Bogoliubov operator method . . . . .	1950
*****	
<b>XVIII REVIEW OF CLASSICAL ELECTRODYNAMICS</b>	<b>1957</b>
A Classical electrodynamics . . . . .	1959
B Describing the transverse field as an ensemble of harmonic oscillators . . . . .	1968
<b>READER'S GUIDE FOR COMPLEMENTS</b>	<b>1977</b>
<b>Axviii Lagrangian formulation of electrodynamics</b>	<b>1979</b>
1 Lagrangian with several types of variables . . . . .	1980
2 Application to the free radiation field . . . . .	1986
3 Lagrangian of the global system field + interacting particles . . . . .	1992
*****	

<b>XIX QUANTIZATION OF ELECTROMAGNETIC RADIATION</b>	<b>1997</b>
A Quantization of the radiation in the Coulomb gauge . . . . .	1999
B Photons, elementary excitations of the free quantum field . . . . .	2004
C Description of the interactions . . . . .	2008
 <b>READER'S GUIDE FOR COMPLEMENTS</b>	 <b>2017</b>
 <b>Axix Momentum exchange between atoms and photons</b>	 <b>2019</b>
1 Recoil of a free atom absorbing or emitting a photon . . . . .	2020
2 Applications of the radiation pressure force: slowing and cooling atoms . . . . .	2025
3 Blocking recoil through spatial confinement . . . . .	2036
4 Recoil suppression in certain multi-photon processes . . . . .	2040
 <b>Bxix Angular momentum of radiation</b>	 <b>2043</b>
1 Average value of angular momentum for a spin 1 particle . . . . .	2044
2 Angular momentum of free classical radiation as a function of normal variables	2047
3 Discussion . . . . .	2050
 <b>Cxix Angular momentum exchange between atoms and photons</b>	 <b>2055</b>
1 Transferring spin angular momentum to internal atomic variables . . . . .	2056
2 Optical methods . . . . .	2058
3 Transferring orbital angular momentum to external atomic variables . . . . .	2065
*****	
 <b>XX ABSORPTION, EMISSION AND SCATTERING OF PHOTONS</b>	
<b>BY ATOMS</b>	<b>2067</b>
A A basic tool: the evolution operator . . . . .	2068
B Photon absorption between two discrete atomic levels . . . . .	2073
C Stimulated and spontaneous emissions . . . . .	2079
D Role of correlation functions in one-photon processes . . . . .	2083
E Photon scattering by an atom . . . . .	2085
 <b>READER'S GUIDE FOR COMPLEMENTS</b>	 <b>2095</b>
 <b>Axx A multiphoton process: two-photon absorption</b>	 <b>2097</b>
1 Monochromatic radiation . . . . .	2097
2 Non-monochromatic radiation . . . . .	2101
3 Discussion . . . . .	2105
 <b>Bxx Photoionization</b>	 <b>2109</b>
1 Brief review of the photoelectric effect . . . . .	2110
2 Computation of photoionization rates . . . . .	2112
3 Is a quantum treatment of radiation necessary to describe photoionization? .	2117
4 Two-photon photoionization . . . . .	2123
5 Tunnel ionization by intense laser fields . . . . .	2126

<b>C<sub>XX</sub> Two-level atom in a monochromatic field. Dressed-atom method</b>	<b>2129</b>
1 Brief description of the dressed-atom method . . . . .	2130
2 Weak coupling domain . . . . .	2137
3 Strong coupling domain . . . . .	2141
4 Modifications of the field. Dispersion and absorption . . . . .	2147
<b>D<sub>XX</sub> Light shifts: a tool for manipulating atoms and fields</b>	<b>2151</b>
1 Dipole forces and laser trapping . . . . .	2151
2 Mirrors for atoms . . . . .	2153
3 Optical lattices . . . . .	2153
4 Sub-Doppler cooling. Sisyphus effect . . . . .	2155
5 Non-destructive detection of a photon . . . . .	2159
<b>E<sub>XX</sub> Detection of one- or two-photon wave packets, interference</b>	<b>2163</b>
1 One-photon wave packet, photodetection probability . . . . .	2165
2 One- or two-photon interference signals . . . . .	2167
3 Absorption amplitude of a photon by an atom . . . . .	2174
4 Scattering of a wave packet . . . . .	2176
5 Example of wave packets with two entangled photons . . . . .	2181
*****	
<b>XXI QUANTUM ENTANGLEMENT, MEASUREMENTS, BELL'S INEQUALITIES</b>	<b>2187</b>
A Introducing entanglement, goals of this chapter . . . . .	2188
B Entangled states of two spin-1/2 systems . . . . .	2190
C Entanglement between more general systems . . . . .	2193
D Ideal measurement and entangled states . . . . .	2196
E "Which path" experiment: can one determine the path followed by the photon in Young's double slit experiment? . . . . .	2202
F Entanglement, non-locality, Bell's theorem . . . . .	2204
<b>READER'S GUIDE FOR COMPLEMENTS</b>	<b>2215</b>
<b>A<sub>XXI</sub> Density operator and correlations; separability</b>	<b>2217</b>
1 Von Neumann statistical entropy . . . . .	2217
2 Differences between classical and quantum correlations . . . . .	2221
3 Separability . . . . .	2223
<b>B<sub>XXI</sub> GHZ states, entanglement swapping</b>	<b>2227</b>
1 Sign contradiction in a GHZ state . . . . .	2227
2 Entanglement swapping . . . . .	2232
<b>C<sub>XXI</sub> Measurement induced relative phase between two condensates</b>	<b>2237</b>
1 Probabilities of single, double, etc. position measurements . . . . .	2239
2 Measurement induced enhancement of entanglement . . . . .	2242
3 Detection of a large number $Q$ of particles . . . . .	2245

<b>D<sub>XXI</sub></b>	<b>Emergence of a relative phase with spin condensates; macroscopic non-locality and the EPR argument</b>	<b>2253</b>
1	Two condensates with spins . . . . .	2254
2	Probabilities of the different measurement results . . . . .	2255
3	Discussion . . . . .	2259
*****		
<b>APPENDICES</b>		<b>2267</b>
<b>IV</b>	<b>Feynman path integral</b>	<b>2267</b>
1	Quantum propagator of a particle . . . . .	2267
2	Interpretation in terms of classical histories . . . . .	2272
3	Discussion; a new quantization rule . . . . .	2274
4	Operators . . . . .	2276
<b>V</b>	<b>Lagrange multipliers</b>	<b>2281</b>
1	Function of two variables . . . . .	2281
2	Function of $N$ variables . . . . .	2283
<b>VI</b>	<b>Brief review of Quantum Statistical Mechanics</b>	<b>2285</b>
1	Statistical ensembles . . . . .	2285
2	Intensive or extensive physical quantities . . . . .	2292
<b>VII</b>	<b>Wigner transform</b>	<b>2297</b>
1	Delta function of an operator . . . . .	2299
2	Wigner distribution of the density operator (spinless particle) . . . . .	2299
3	Wigner transform of an operator . . . . .	2310
4	Generalizations . . . . .	2318
5	Discussion: Wigner distribution and quantum effects . . . . .	2319
<b>BIBLIOGRAPHY OF VOLUME III</b>		<b>2325</b>
<b>INDEX</b>		<b>2333</b>
