Preface	xii
Introduction	xiii
Acknowledgments	xv
List of symbols	1
Chapter 1	
Polymerization	11
1. Basic processes and the initiator	12
1.1 Separation of basic processes	12
1.2 The initiator	12
2. Classification according to type of active centre	14
3. Classification according to reactivity of active centres	14
4. Classification according to number of monomers	14
5. Classification according to number of phases at the beginning and during reaction	16
6. Liquid phase polymerization	18
7. Classification according to the arrangement of chains formed	21
8. Kinetic factors	22
9. Special kinds of polymerizations	24
9.1 Ring opening polymerization	24
9.2 Cyclopolymerization	24
9.3 Polymerization by activated monomer mechanism	25
9.4 Isomerization polymerization	25
9.5 Topochemical polymerization	25
9.6 Popcorn polymerization	26
9.7 Group transfer polymerization	26
References	26
Chapter 2	
Monomers	37
1. Classification of monomers	37
1.1 Chemical classification	37
1.1.1 Vinyl and vinylidene monomers	28
1.1.2 Dienes	29

1.1.3 Alkynes	31
1.1.4 Cyclic monomers	31
1.1.5 Other monomers	38
1.2 Relationship between monomer structure and its polymerization mode	40
1.3 Donor-acceptor properties of monomers	42
1.3.1 Monomers as electron donors	43
1.3.2 Monomers as electron acceptors	43
2. Properties of polymerizing monomers	44
2.1 Physical properties of monomers	44
2.2 Chemical properties of monomers	45
3. Reactivity of monomers	45
4. Monomer and other components of the system	61
4.1 Physical relationship	62
4.2 Chemical interactions	62
4.2.1 Monomer complexes	63
5. Two, three or more types of monomer	65
5.1 Non-complexing monomers	65
5.2 Monomers forming donor-acceptor complexes	65
6. Models of monomers	68
References	69

Chapter 3

Initiation	75
1. Formation of primary radicals	75
1.1. Thermal initiation	75
1.2 Initiators	78
1.2.1 Peroxides and their decomposition	79
1.2.2 Azo-initiators and their decomposition	85
1.3 Photo-initiation	88
1.3.1 Sensitization	89
1.4 Initiators produced in situ	91
1.4.1 Effect of oxygen	93
1.5 Other methods leading to radical formation	93
1.6 Non-typical initiators	95
1.6.1 Multifunctional initiators	95
1.6.2 Polymeric initiators	96
1.7 Behaviour of primary radicals	98
1.7.1 Cage effect	98
1.7.2 Efficiency of initiation	99
1.8 Reaction of radical with unsaturated molecule	101
1.8.1 Initiation of radical polymerization	101
2. Formation of initiating anion	102
2.1 Properties of metal-carbon bond	103
2.1.1 Initiation by alkylmetals	105
2.2 Properties of metal-oxygen and metal-nitrogen bonds	112
2.2.1 Initiation by alkoxides	112
2.3 Electron transfer from donor to monomer	114
2.3.1 Initiation by alkali metals	115
2.3.2 Initiation by radical anions	116

2.4 Other methods leading to initiating anions	118
2.4.1 Multifunctional carbanions	118
2.4.2. Macroanions	119
2.5 Reaction of anion with monomer	119
2.5.1 Initiation of anionic polymerization	121
2.5.2 Activators of anionic polymerization	123
3. Formation of initiating cation	124
3.1 Initiators of cationic polymerizations	124
3.1.1 Brönsted acids	125
3.1.2 Lewis acids	126
3.2 Special kinds of initiators	129
3.2.1 Initiation by HI/I ₂	129
3.2.2 Multifunctional initiators	130
3.2.3 Macrocations	131
3.3 Reaction of cation with monomer	132
4. Formation of complexes initiating coordination polymerizations	133
4.1 Ziegler-Natta catalysts	133
4.1.1 Supported catalysts	136
4.1.2 Cocatalysts of ZN catalysts	137
4.1.3 Internal and external donors	139
4.1.4 Dual function catalysts	139
4.1.5 Reaction of Ziegler-Natta centres with monomers	140
4.2 Transition metal catalyst active in absence of alkylmetals	141
5. Initiating donor-acceptor complexes	143
5.1 Formation of radical-ions and their reaction with monomers	143
5.2 Polymerizations initiated by thermally activated donor-acceptor complexes	145
5.2.1 Polycombination of zwitterions	147
5.3 Monomers as ion pairs (monomer salts)	148
6. Other types of initiation	149
6.1 Electroinitiation	149
6.2 Mechanochemical initiation	150
6.3 Initiation in plasma	151
7. Initiation of non-polymerizing compounds	151
8. Initiation kinetics	153
References	154

Chapter 4

Active centres of polymerizations	163
1. Active centres of radical polymerizations	164
1.1 Reactivity of radicals	165
1.2 Reactivity of radical centres during polymerization	172
1.3 "Hot" radicals	174
1.4 Intervention in the structure of centres	176
1.5 Some radicals of particular importance	179
2. Ionic active centres	180
2.1 Ions, ion pairs and their associates	180
2.2 Centres of anionic polymerization	183
2.2.1 Carbanions	184
2.2.2 Other anions	188

2.3 Centres of cationic polymerizations	191
2.3.1 Carbocations	191
2.3.2 Carboxonium centres	193
2.3.3 Oxonium centres	193
2.3.4 Covalent centres	195
2.3.5 Centres of cationic polymerization with activated monomer	195
2.3.6 Cations derived from elements other than C and O	196
2.4 Zwitterions	197
3. Radical-ions	199
4. Coordination centres	203
4.1 Coordination centres of Ziegler-Natta polymerizations	203
4.1.1 Solid Ziegler-Natta catalysts	203
4.1.2 Soluble Ziegler-Natta catalysts	208
4.1.3 Properties of coordination centres of Ziegler-Natta polymerizations	211
4.2 Other coordination centres	213
5. Transformation of centres	214
5.1 Transformation anion to cation	215
5.2 Transformation cation to anion	216
5.3 Direct transformation anion to cation and cation to anion	216
5.4 Transformation anion to radical	217
5.5 Transformation with the participation of coordination centres	217
5.5.1 Anion to coordination centre	217
5.5.2 Coordination centre to anion	218
5.5.3 Coordination centre to cation	218
5.5.4 Coordination centre to radical	218
5.5.5 Anion to centre of metathesis	219
6. Reaction of coordination centres during polymerization	219
7. Living and dormant centres	221
References	222

Chapter 5

Propagation	231
Theoretical conditions for propagation	231
1.1 Thermodynamic conditions	231
1.1.1 Ceiling (floor) temperature	232
1.1.2 Heat of reaction and entropy changes during polymerization	235
1.1.3 Influence of pressure on propagation	235
1.2 Chemical influence	240
1.2.1 The presence of impurities	240
1.2.2 Propagation and polycondensation	241
1.3 Kinetic influence	242
1.3.1 Stationary polymerization	242
1.3.2 Non-stationary polymerization	243
1.3.3 Temperature of polymerization	244
2. Environment surrounding active centre (external influence)	244
2.1 Medium	245
2.2 Consequences of polymer formation	247
2.2.1 Viscosity increase	247
2.2.2 Solid phase formation	250

2.2.3 Active centres and polymer	251
2.2.4 The matrix (template) effect	252
3. General features of propagation	256
3.1 Conversion	256
3.2 Transfer of heat during polymerization	259
3.3 Volume contraction of the polymerizing system	260
4. Controlled propagation	261
4.1 Stereospecific growth	262
4.1.1 Chain configuration and statistics of stereochemical propagation	262
4.1.2 General factors controlling the mode of addition	264
4.1.3 Enantioselective (stereoelective) and enantioselective (stereoselective) polymerization	268
4.1.4 Propagation on the transition metal-carbon bond	270
4.2 Polymerization in micelles (emulsion polymerization)	280
4.2.1 Initiation in the aqueous phase	281
4.2.2 Polymerization in emulsion initiated by an insoluble initiator	288
4.2.3 Inverse emulsion polymerization	288
4.2.4 Ionic emulsion polymerization	289
5. Copolymerization	289
5.1 Copolymerization equation	290
5.2 Copolymerization parameters	293
5.2.1 The experimental determination of copolymerization parameters	295
5.2.2 The theory of copolymerization parameters	300
5.2.3 The distribution of monomeric units in the copolymer	306
5.3 Ionic copolymerization	310
5.4 Coordination copolymerization	311
5.5 Multicomponent copolymerization	312
5.5.1 The penultimate effect	312
5.5.2 Copolymerization with monomers and their complexes	313
5.5.3 Ternary copolymerization and copolymerization of more than three monomers	314
5.6 Thermodynamics of copolymerization	320
5.6.1 Copolymerization at temperatures above T_c of one of the monomers	326
5.7 Copolymerization kinetics	328
5.8 Copolymerization types	332
5.8.1 Polymerizations producing periodic copolymers	332
5.8.2 Block copolymers	335
5.8.3 Graft copolymers	336
6. Mechanism of propagation	338
6.1 Addition	338
6.2. Insertion	339
6.2.1 Coordination insertion	339
6.3 Ring-opening polymerizations	341
6.3.1 The formation of macrocycles during ring-opening polymerization	346
6.3.2 Metathesis	348
6.3.3 Polymerization on activated ligands	349
6.4 Cyclopolymerization	350
6.5 Polymerization with activated monomer	352
6.6 Isomerization polymerization	352
6.7 Group-transfer polymerization	352
6.8 Branching, cross-linking	356

7. Depropagation	360
8. Propagation kinetics	362
8.1 Propagation in living systems	363
8.1.1 Determination of propagation rate on free ions and ion-pairs in living polymerizations	363
8.2 Rate constant of propagation	369
References	369
<i>Chapter 6</i>	
Termination	383
1. Decay of radical activity	383
1.1 Combination, disproportionation of radicals	383
1.1.1 The effect of pressure on termination	390
1.1.2 The effect of polymer concentration and chain lengths	393
1.2 Termination of and by primary radicals	394
1.3 Systems with retarded termination	395
1.3.1 The gel effect	396
1.3.2 Trapped radicals	399
1.4 Inhibition, inhibitors	401
1.4.1 Autoinhibition	404
1.5 Non-stationary states of radical polymerizations	405
1.5.1 The pre-effect of radical polymerization accompanied by mutual radical termination	406
1.5.2 The decay of radical polymerization due to mutual termination of radicals	408
1.5.3 Rotating sectors	408
1.5.4 Spatially intermittent polymerization	414
2. Termination of ionic polymerizations	417
2.1 Termination involving counter ion	417
2.1.1 Shift of equilibria between ions, ion pairs, and esters	417
2.1.2 Combination of ions	418
2.1.3 Termination by unstable counter-ion	419
2.2 Transformation of an active centre to an inactive species or to an ion of low activity	420
2.2.1 Aggregation (association) of centres	420
2.2.2 Polymerization-inactive complexes of ions	422
2.2.3 Autoinhibition (autotermination)	424
2.2.4 Termination due to improper addition of monomers	426
2.2.5 Termination by impurities	426
2.3 Combination of macroions	427
3. Termination of coordination polymerizations	428
3.1 Termination by donors	428
3.2 Termination by breaking metal-polymer bond in active centre	428
3.3 Termination by deactivation of the organometallic component	429
3.4 "Spontaneous" termination	429
4. Use of termination	430
4.1 Macromers (macromonomers)	430
4.2 Desactivation of centres	431
4.2.1 Determination of the number of centres	431
5. Kinetics of termination	435
References	438

Chapter 7

Transfer	443
1. General characteristics of transfer reactions	443
1.1 Retardation	444
1.1.1 Degradative transfer	450
1.2 Branching (cross-linking) by transfer	451
1.2.1 Branching by the "wrong" addition of monomer or initiator	452
1.2.2 Multifunctional transfer agents	453
1.2.3 Transfer to polymer	453
1.3 Reversible transfer	454
2. Transfer in radical polymerizations	454
2.1 Mechanism of some transfers	455
3. Transfers in anionic polymerizations	457
3.1 Transfers of H^- , H^+	457
4. Transfers in cationic polymerizations	459
4.1 Transfer during polymerization of hydrocarbon monomers and of monomers containing heteroatoms in side chain	460
4.2 Transfers during polymerization of heterocyclic monomers	461
5. Transfers in coordination polymerization	462
5.1 Transfers by organometallics	462
5.2 Transfers by molecular H_2	463
5.3 Other transfers of coordination polymerizations	464
6. Molecular mass of polymerization products	464
7. Copolymerizing transfer agents	469
8. The use of transfers	473
8.1 Control of molecular mass	473
8.2 Grafting by transfer process	473
8.3 Formation of macromers by transfer	474
8.3.1 Inifer, iniferter techniques	475
References	476

Chapter 8

Kinetics	481
1. Polymerization rate	481
1.1 Rate of initiation	482
1.2 Radical polymerization	484
1.2.1 Overall reaction rate of ideal polymerization	485
1.2.2 Reactions of radicals of various lengths	490
1.2.3 Non-ideal radical polymerization	492
1.2.4 Example: kinetic analysis of vinyl chloride polymerization	497
1.3 Ionic polymerization	502
1.3.1 Living polymerization with slow initiation	502
1.3.2 Living equilibrium copolymerization	505
1.3.3 Non-stationary polymerization	511
1.3.4 Example: propagation of heterocycles. Periodic changes of growing centre reactivity	514
1.4 Coordination polymerization	515
1.4.1 Kinetic model of Ziegler-Natta polymerizations	515
1.4.2 Example: polymerization of ethylene	523

2. The degree of polymerization of the product	526
2.1 Molecular mass distribution of the product	527
2.1.1 Number and weight (mass) average degrees of polymerization	529
2.1.2 Rate of living polymerizations and molecular mass distribution curves of products	531
2.1.3 Molecular mass distribution in products of radical polymerizations	535
2.1.4 Example: changes of molecular mass distribution during polymerization of heterocycles	539
References	544

Chapter 9

Conclusion	547
1. Activation energy of polymerization and thermodynamics	547
2. Replacement of active centers by a high frequency magnetic field	549

Index	552
