Notation	9
Preface	13
1. Basic concepts of network theory	15
1.1. The electrical network, its components and variables	15
1.1.1. The electrical network	15
1.1.2. The components of the network	16
1.1.3. The variables of the network	17
1.1.4. The characteristics of the component	22
1.2. The structure of the network	23
1.2.1. Constraints on the variables	23
1.2.2. The pole-node chart	24
1.2.3. The junction matrix	26
1.2.4. The terminal-node chart	28
1.2.5. The node matrix	30
2. Analysis of linear networks in the frequency domain	34
2.1. Characteristics and equations in the frequency domain	34
2.1.1. Types of characteristics	34
2.1.2. The y - (admittance) characteristics	35
2.1.3. The necessity for more general characteristics	44
2.1.4. The x - (hybrid) characteristics	45
2.1.5. The w -characteristics	53
2.1.6. The determinative characteristics	55
2.1.7. The structure and solvability of network equations	58
2.2. Formulation of the network equations on the basis of the circuit diagram	61
2.2.1. Networks containing y -components	61
2.2.2. Networks containing arbitrary components	65
2.2.3. The calculation of characteristics	69
2.3. Formulation of the complete set of equations	72
2.3.1. Networks containing y -components	72
2.3.2. Networks containing arbitrary components	75
2.3.3. Application of the pole y -characteristics	81
2.3.4. Formulation of determinative characteristics	84
2.4. Formulation of the reduced set of equations	86
2.4.1. Networks containing y -components	87

2.4.2.	Networks containing arbitrary components	90
2.4.3.	Application of the pole y -characteristics	95
2.4.4.	Formulation of determinative characteristics	97
3.	Analysis of linear dynamic networks in the time domain	100
3.1.	Characteristics and network equations	100
3.1.1.	The components of the network	100
3.1.2.	Initial values	107
3.1.3.	Regularity of the network	108
3.1.4.	State variable description	110
3.1.5.	The state variable characteristics	114
3.2.	Formulation of the state variable normal form on the basis of the circuit diagram	120
3.2.1.	Networks consisting of specific components	120
3.2.2.	Networks consisting of general components	124
3.2.3.	Formulation of state variable characteristics	127
3.3.	Formulation of the state variable normal form on the basis of the complete set of equations	129
3.3.1.	Networks consisting of specific components	129
3.3.2.	Networks consisting of general components	137
3.3.3.	Formulation of state variable characteristics	140
3.4.	Formulation of the state variable normal form on the basis of the reduced set of equations	142
3.4.1.	Networks consisting of specific components	143
3.4.2.	Networks consisting of general components	147
3.4.3.	Formulation of state variable characteristics	150
4.	Analysis of nonlinear resistive networks	152
4.1.	Characteristics and equations	152
4.1.1.	The components of the network	152
4.1.2.	The network equations	154
4.2.	Formulation of the canonical equation on the basis of the circuit diagram	158
4.3.	Formulation of the canonical equations on the basis of the complete set of equations	160
4.3.1.	Description of the network	160
4.3.2.	The complete set of equations	161
4.3.3.	Reduction of the set of equations	162
4.4.	Formulation of the canonical equations on the basis of the reduced set of equations	163
4.4.1.	Description of the network	163
4.4.2.	The structure of the set of equations	164
4.4.3.	Formulation of the matrices	165
5.	Analysis of nonlinear and time-varying networks in the time domain	168
5.1.	Characteristics and network equations	168
5.1.1.	The components of the network	168
5.1.2.	The canonical form of the state variable description	171
5.1.3.	The state variable characteristics	177
5.2.	Formulation of the state variable canonical form on the basis of the circuit diagram	181
5.2.1.	Networks consisting of specific components	181
5.2.2.	Networks consisting of general components	183

5.3.	Formulation of the state variable canonical form on the basis of the complete set of equations	185
5.3.1.	Networks consisting of specific components	185
5.3.2.	Networks consisting of general components	188
5.4.	Formulation of the state variable canonical form on the basis of the reduced set of equations	193
5.4.1.	Networks consisting of specific components	193
5.4.2.	Networks consisting of general components	198
6.	Calculation of transfer quantities and sensitivities	202
6.1.	Transfer quantities	202
6.1.1.	Definition of transfer quantities	202
6.1.2.	Calculation of transfer quantities	203
6.2.	Sensitivity	205
6.2.1.	The concept of tolerance	205
6.2.2.	The concept of sensitivity	206
6.2.3.	Calculation of sensitivities	208
6.3.	Calculation with the aid of the state variable description	209
6.3.1.	The state variable description	209
6.3.2.	Formulation of the transfer function	211
6.3.3.	Formulation of the sensitivity function	215
6.4.	Calculation at fixed frequency	220
6.4.1.	Calculation of the transfer coefficient	220
6.4.2.	Calculation of the sensitivities	223
7.	Analysis of linear signal-flow networks	228
7.1.	The general laws of signal-flow networks	228
7.1.1.	The concept of signal-flow network	228
7.1.2.	The variables of the signal-flow network	230
7.1.3.	Components of linear signal-flow networks	232
7.1.4.	Interconnection constraints	237
7.2.	Description of the structure	241
7.2.1.	The circuit diagram	242
7.2.2.	The junction data set	242
7.2.3.	Junction matrices	245
7.3.	Analysis of signal-flow networks in the frequency domain	248
7.3.1.	Formulation of the network equations on the basis of the circuit diagram	248
7.3.2.	Regularity, realizability	253
7.3.3.	The formulation, reduction and solution of the complete set of equations	256
7.3.4.	Formulation and solution of the reduced set of equations	262
7.3.5.	Calculation of the transfer coefficient and its sensitivities	265
7.4.	Analysis of linear signal-flow networks in the time domain	267
7.4.1.	The elementary components of the network	267
7.4.2.	The normal form of the state variable description	269
7.4.3.	Formulation of the state variable description on the basis of the circuit diagram	273
7.4.4.	Formulation of the state variable description on the basis of the complete set of equations	277
7.4.5.	Formulation of the state variable description on the basis of the reduced set of equations	278
7.4.6.	Calculation of the transfer function and its sensitivities	279

7.4.7.	The state variable characteristics and their application	281
7.4.8.	The system equation and its formulation	287
8.	Mixed operation linear signal-flow networks	296
8.1.	The signals, components and interconnection constraints of the network	296
8.1.1.	Time domain description of signals	296
8.1.2.	Frequency domain description of signals	298
8.1.3.	Components of the network	302
8.1.4.	Interconnection rules and constraints	308
8.2.	Analysis in the frequency domain	311
8.2.1.	Network analysis on the basis of the circuit diagram	312
8.2.2.	Formulation and reduction of the complete set of equations	322
8.3.	Analysis in the time domain	324
8.3.1.	Components of the network	324
8.3.2.	The normal form of the state variable description and its solution	325
8.3.3.	Formulation of the state variable normal form	327
8.3.4.	Calculation of transfer functions	332
8.4.	Linear sampled-data networks	333
8.4.1.	The components and signals of sampled-data networks	334
8.4.2.	Held signal sampled-data networks	339
8.4.3.	General sampled-data networks	347
9.	SC networks	360
9.1.	The principle of operation and the signals of SC networks	360
9.1.1.	The principle of operation	360
9.1.2.	Description of signals	366
9.1.3.	The z-domain description of SC two-ports	371
9.1.4.	\mathcal{D} -domain description of SC two-ports	375
9.2.	Formulation of the network equations on the basis of the circuit diagram	381
9.2.1.	Equations relating to capacitor voltages	381
9.2.2.	The method of node potentials	383
9.3.	Algorithmic formulation of the network equations	388
9.3.1.	Statement of the problem	388
9.3.2.	Characteristics of the components	391
9.3.3.	Equations relating to the potentials	392
Literature	396
Subject index	398
